

Modelling optical properties & gain spectra of VCSEL devices

EPIC Meeting on VCSELs at SONY

James Pond, Dylan McGuire, Bozidar Novakovic, Vighen Pacradouni and Geoffrey Duggan

Lumerical Inc.
October 17, 2019

Outline

1. Introduction
2. Optical properties of a VCSEL layer stack
 - Reflectivity Spectrum
 - Quantum Well gain
3. Optical response using 3D FDTD
 - Modal properties of Photonic Crystal VCSELs
4. What's next ?

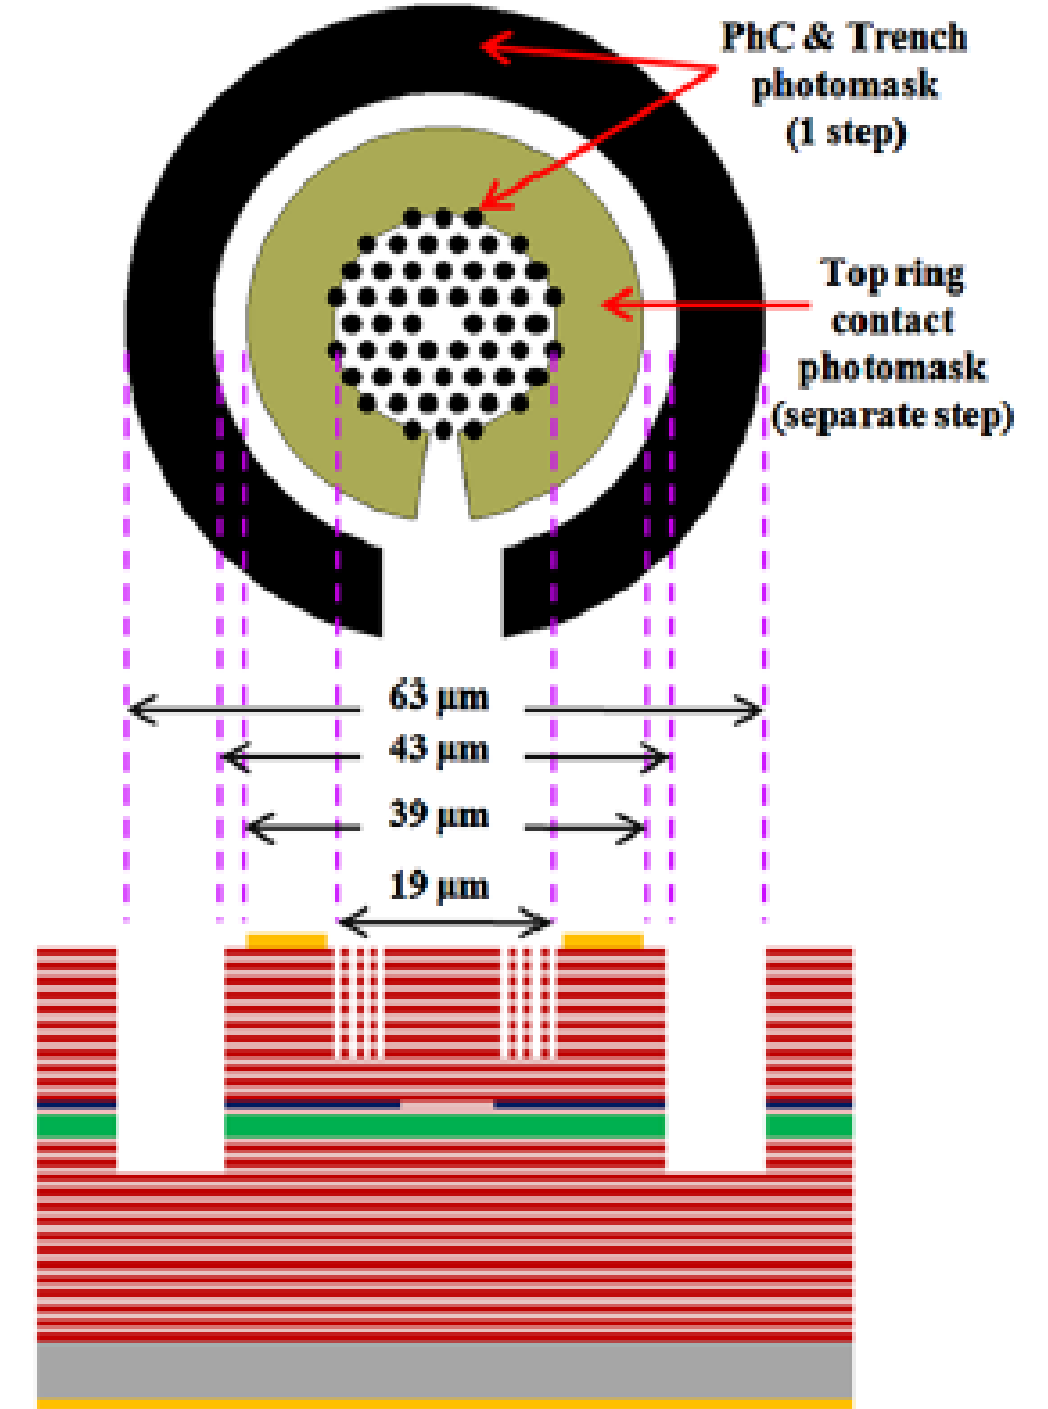

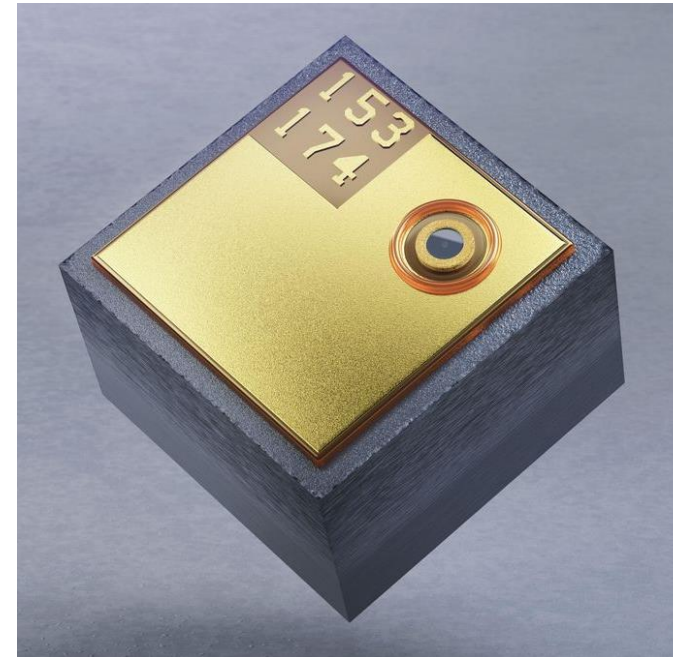

Introduction

VCSEL device manufacture is complex

1. Control of multilayer epitaxy
 - Thickness and composition
 - Doping profiles
 - Graded compositions
 - MQW active regions
2. Multistep device fabrication
 - Oxidation or implantation
 - Multiple etching and lithographic steps
 - Added surface relief or microstructures to achieve desired modal properties
 - *Single mode operation*

Optical Modelling can help with characterization and design

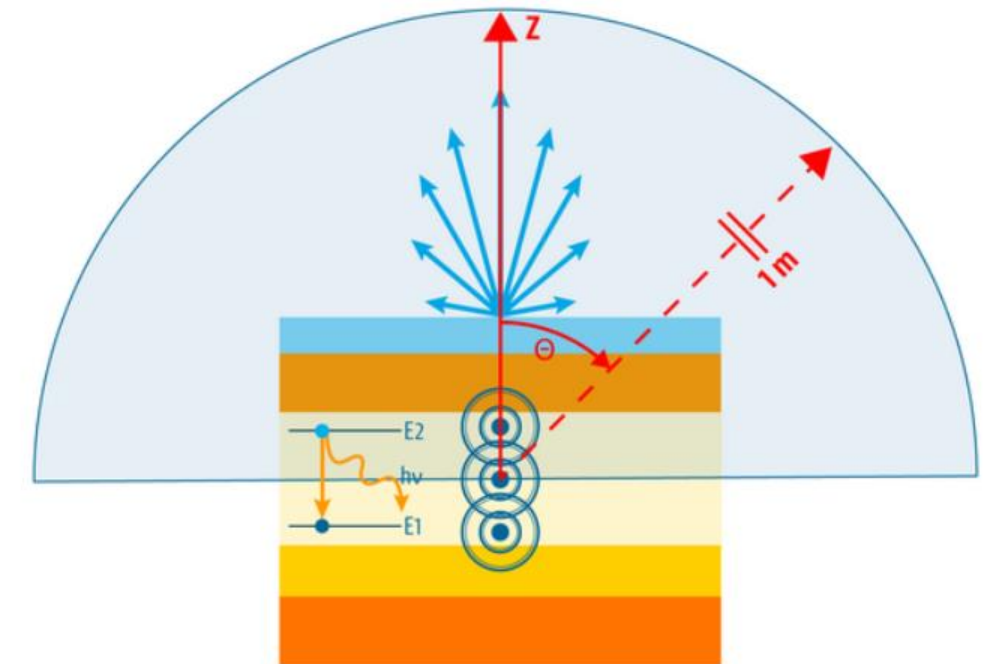

- *Reduces cost and cycle time*

Planar VCSEL Modelling

1-D modelling using a script based approach

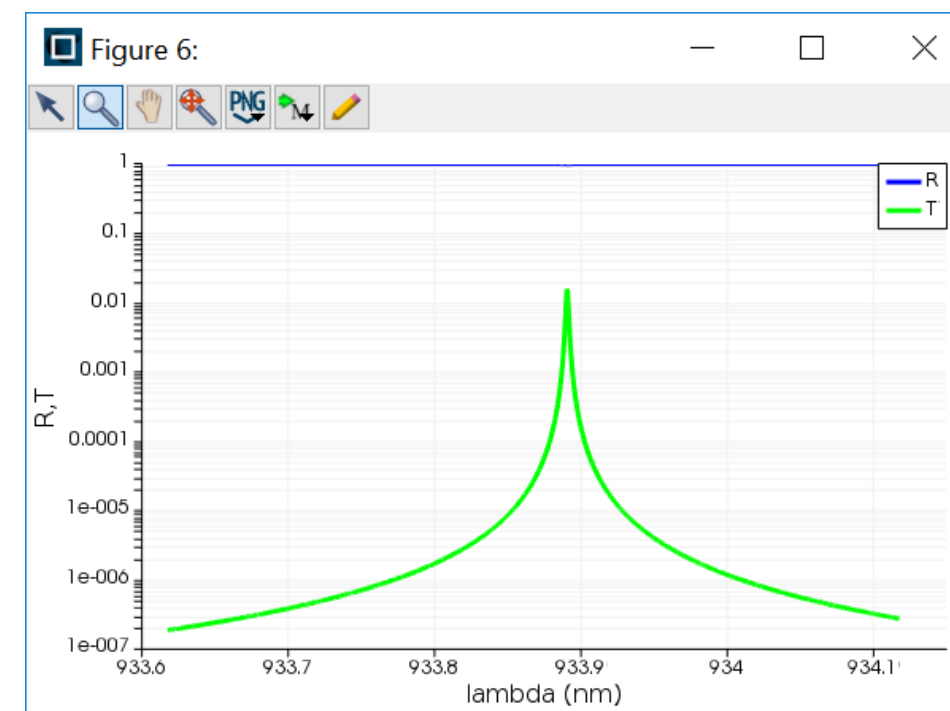

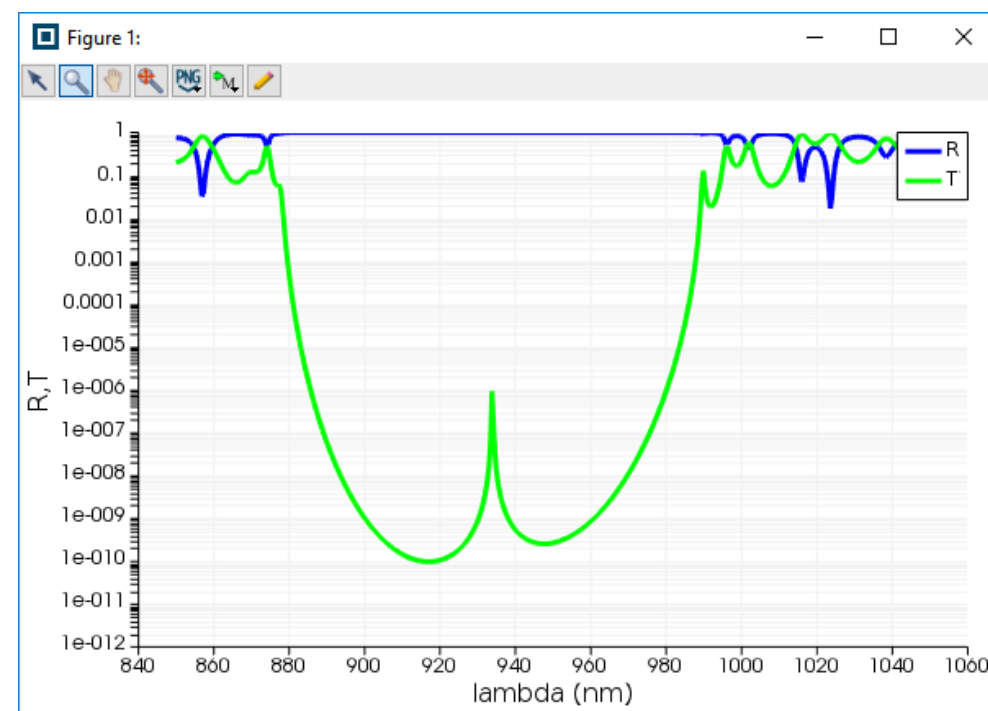

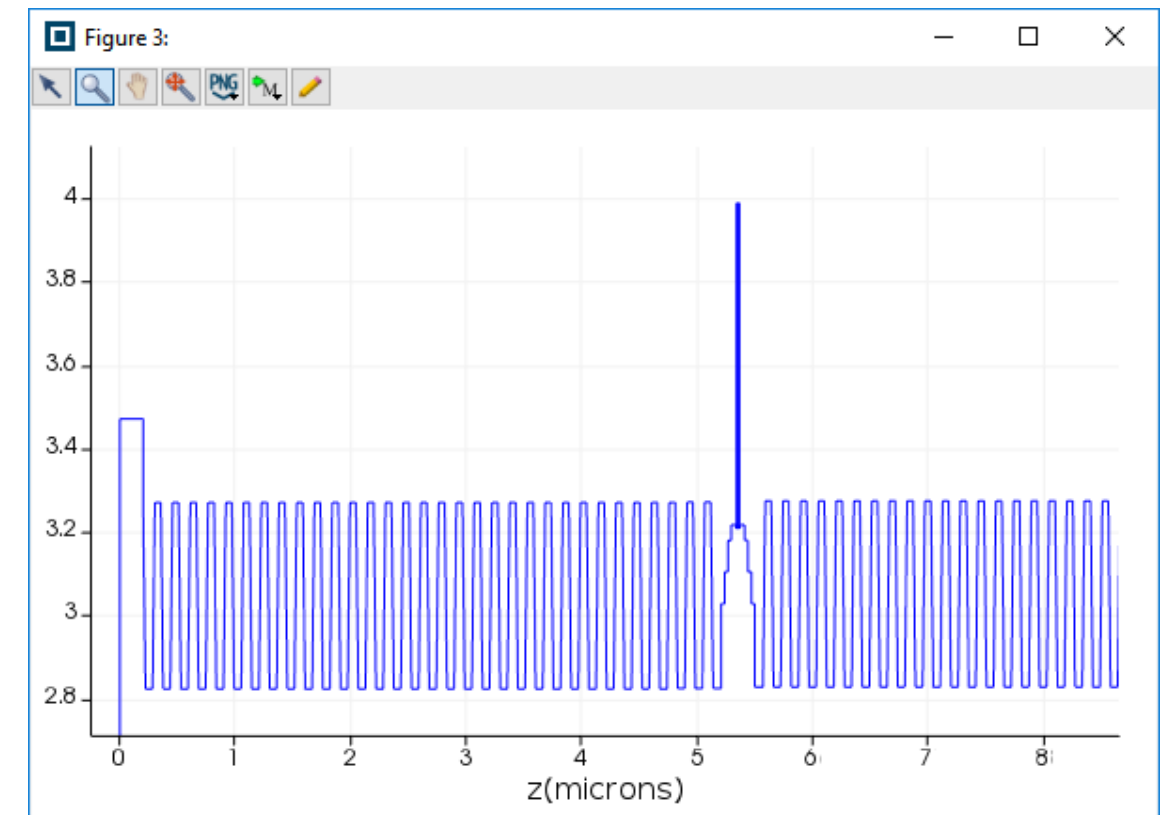

- Models can be built using a GUI, or
- Can import data from external sources e.g. excel spreadsheet
- Uses Lumerical's STACK solver
 - An extensive material database of III-V materials, Eg, ref. index etc...
 - User defined if preferred

A simple example

Run the script file

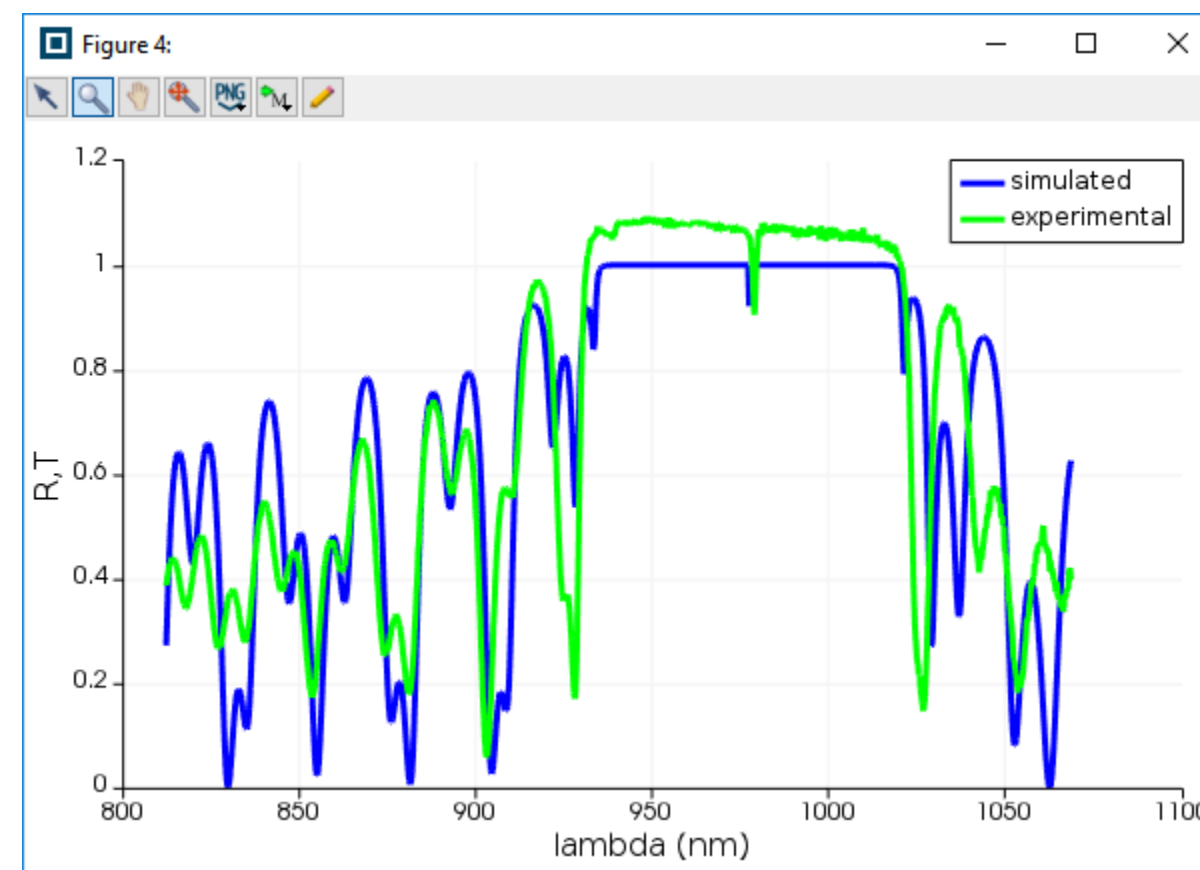

- It reads the layer table and plots n vs z
- It calculates R , T
- It identifies the peak in a given range
- It does a higher resolution calculation near to peak
- It extracts the resonant wavelength
- Purcell factors and dipole emission can also be calculated

Comparison with experiment

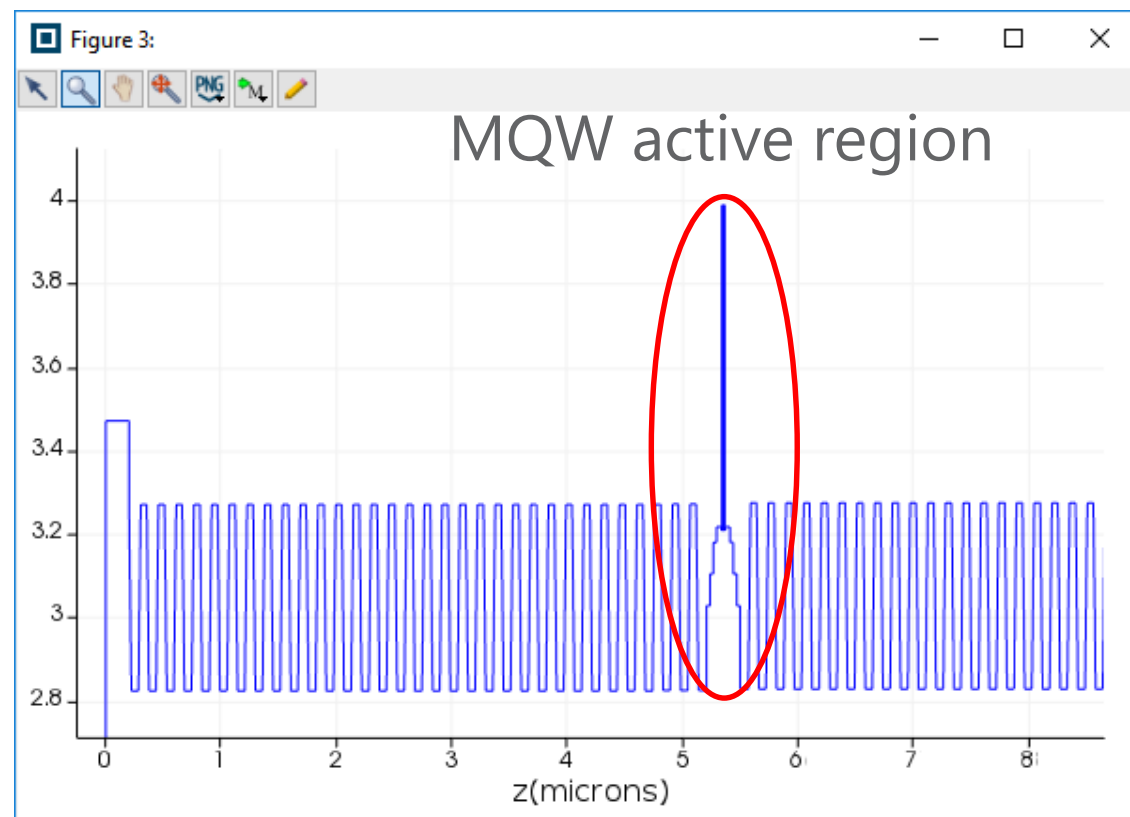

Run a second script

- Uses Python optimization routines to make a constrained fit of the calculated reflectivity to the experimentally observed values
 - Can choose the “best” parameters to vary based on experience
 - Here we varied Al mole fraction and layer thicknesses

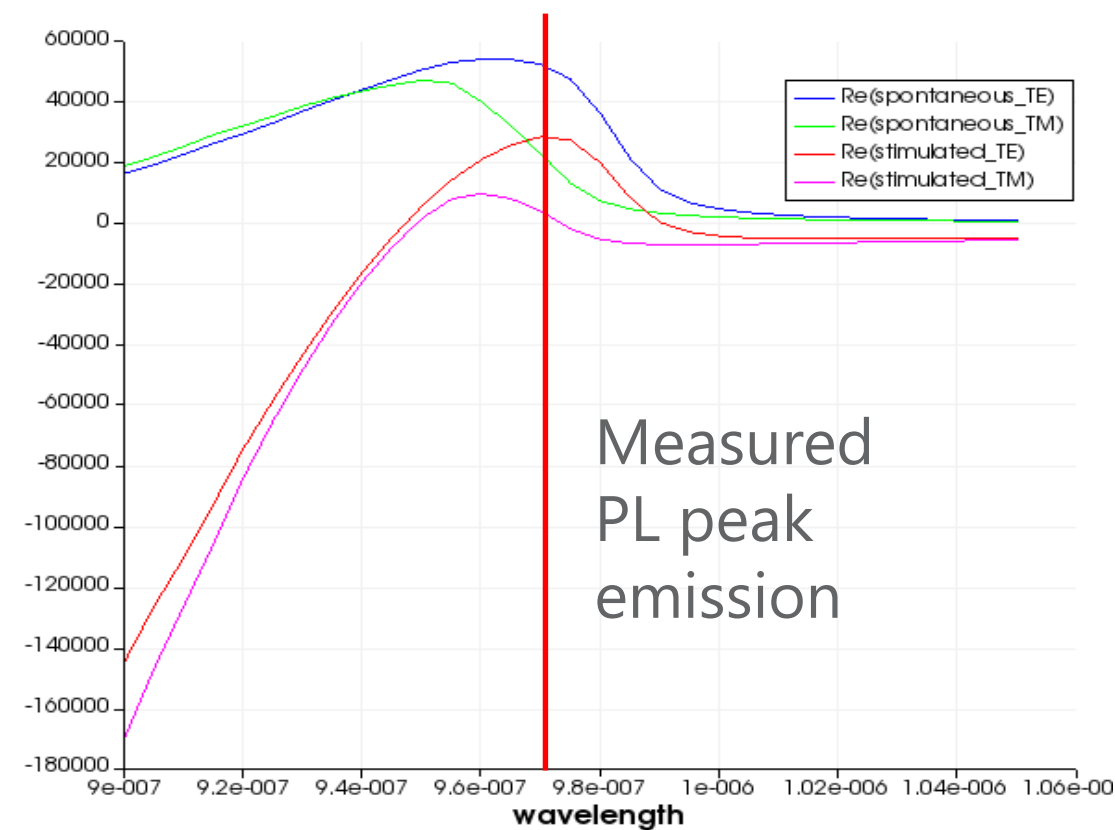

Gain and spontaneous emission from QWs

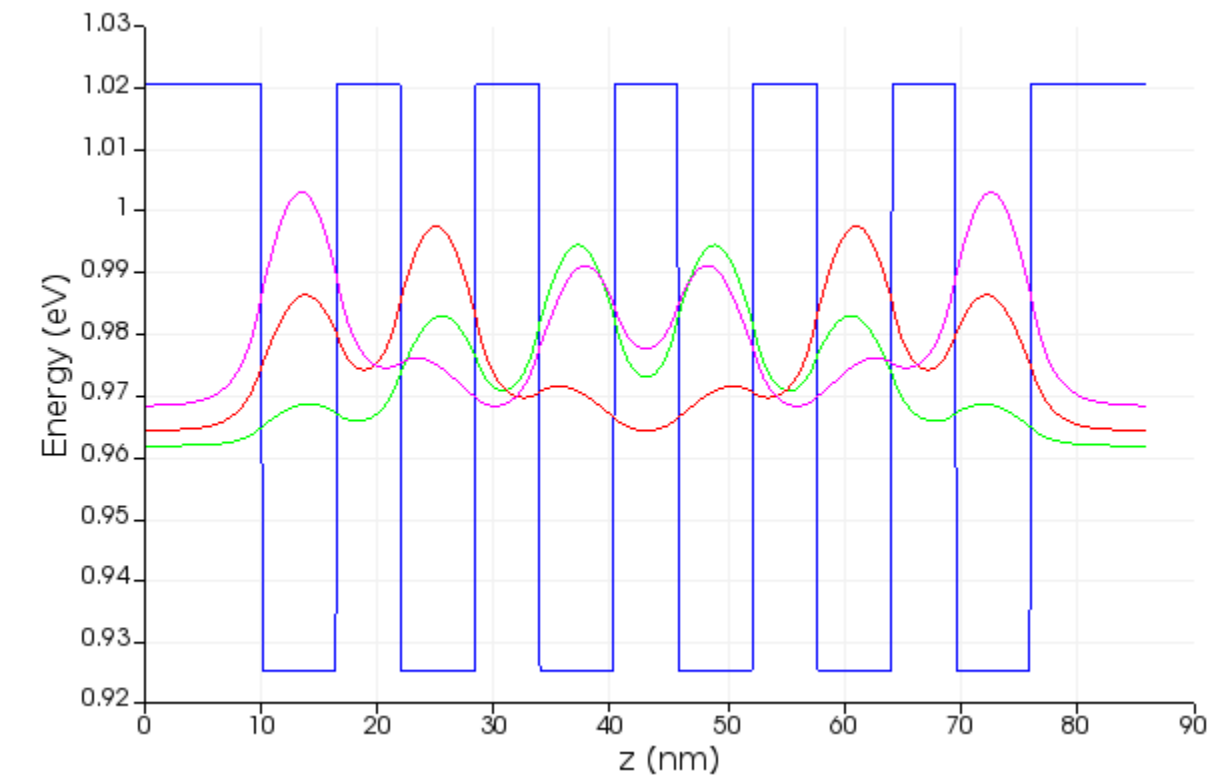

Refractive index in the growth direction

MQW gain simulation

Band diagram and wavefunctions

Calculate gain and spontaneous emission for a multiple quantum well structure

- Accessible through the mqwgain script command

Suitable for III-V material with Zincblende crystal structure (4x4 k.p method)

- Default material database provided for common III-V materials and alloys (e.g. InGaAsP)

VCSEL Modal properties

Single mode operation of Photonic Crystal VCSELs

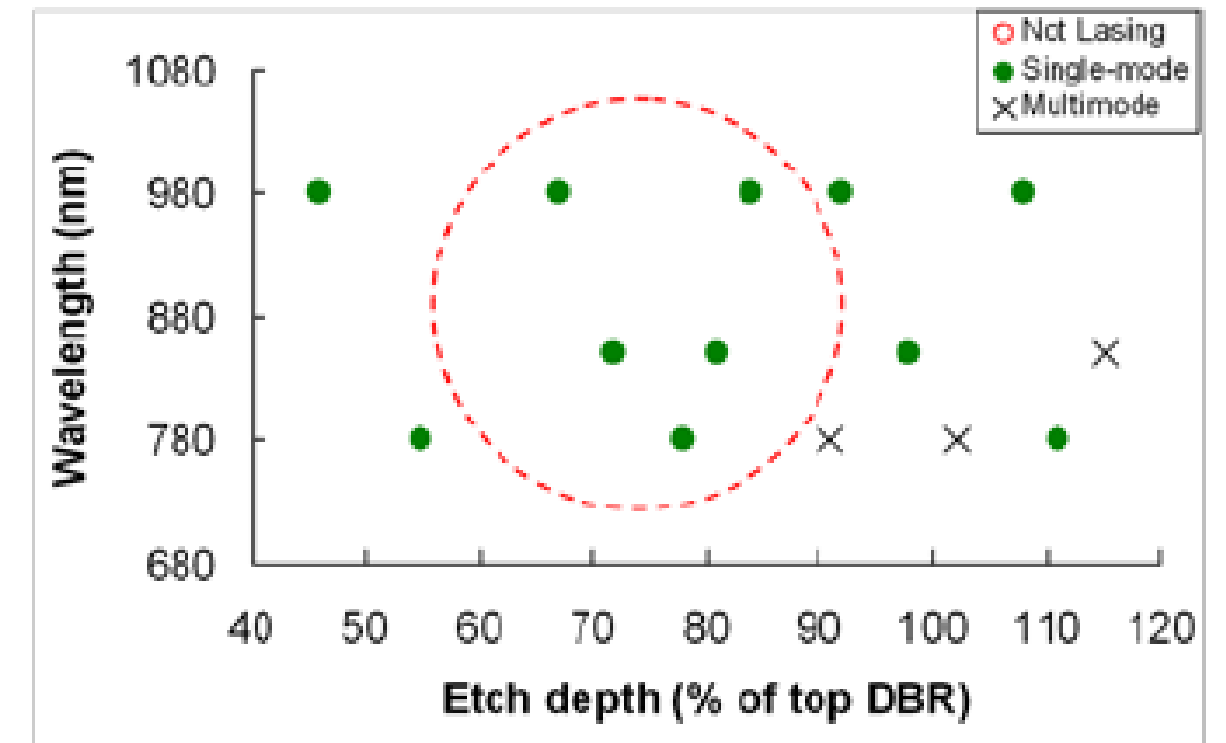

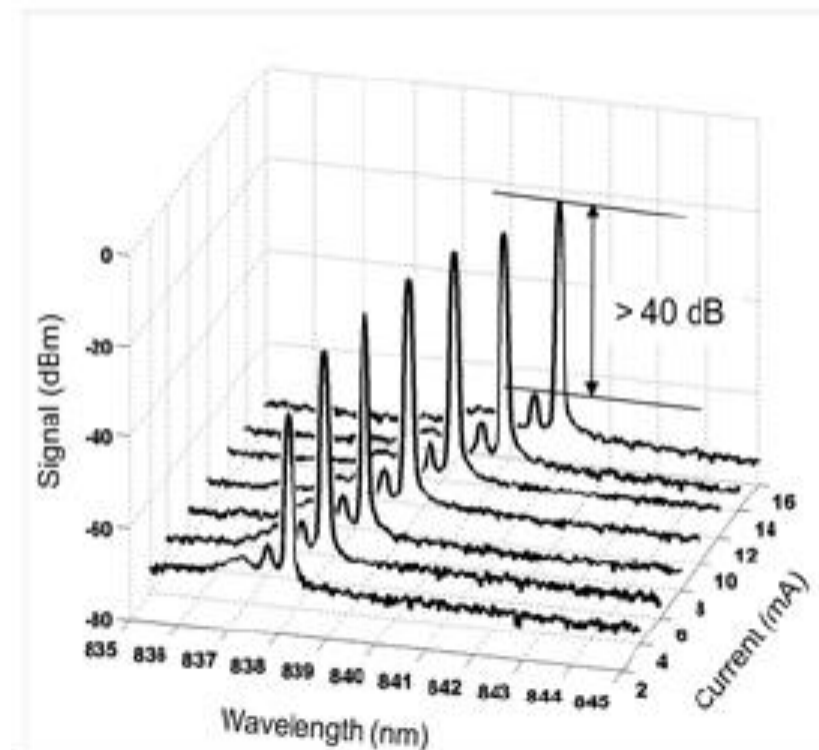

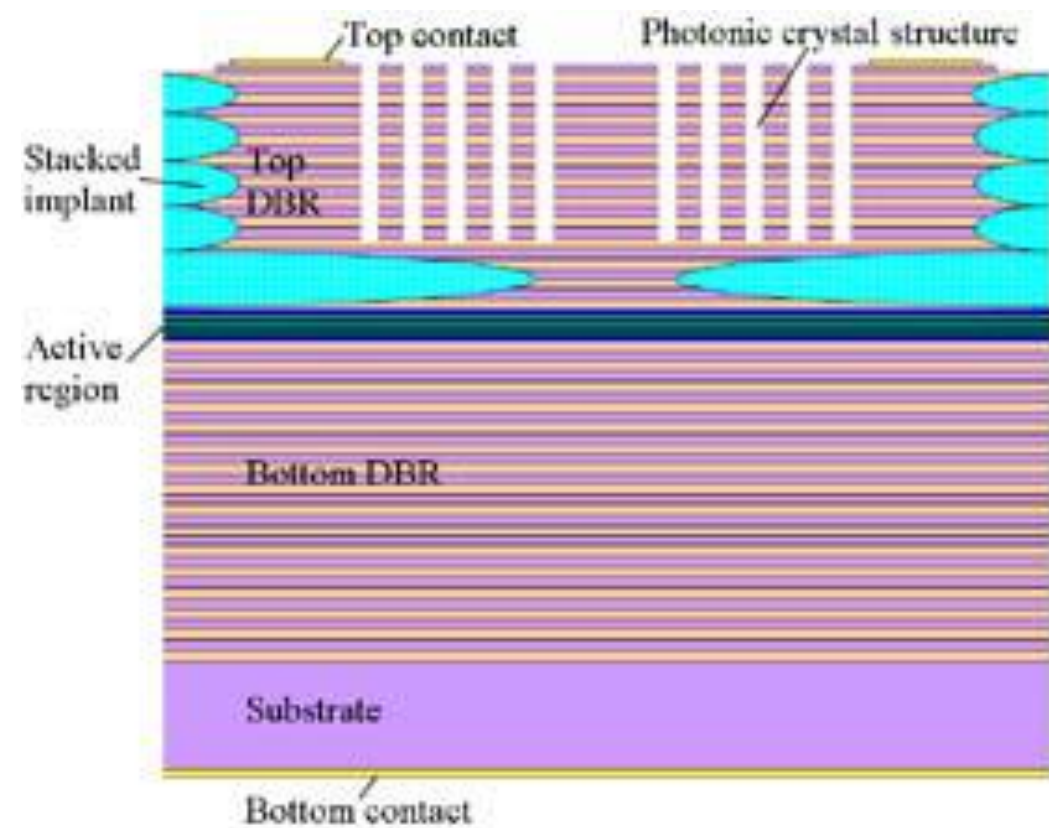

Photonic Crystal (PhC) VCSELs

High Speed Photonic Crystal Vertical Cavity Lasers

Kent D. Choquette, Chen Chen¹, Dominic Siriani, Meng Peun Tan, Matthias Kastan, and David V. Plant¹
Department of Electrical and Computer Engineering
University of Illinois, Urbana, IL, USA
¹Dept. of Electrical and Computer Engineering, McGill University, Montreal, QC, Canada
choquett@illinois.edu

VCSELs require lateral mode control for high performance optical communications and some sensing applications

PhC offer one method of control by varying etch depth and pitch

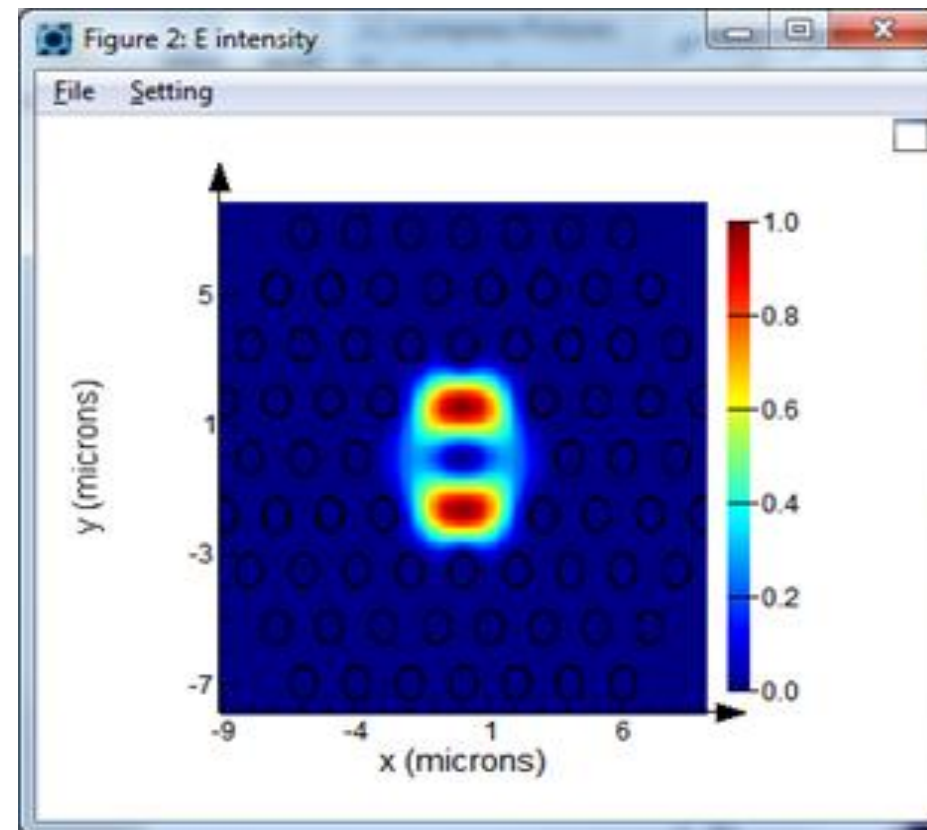

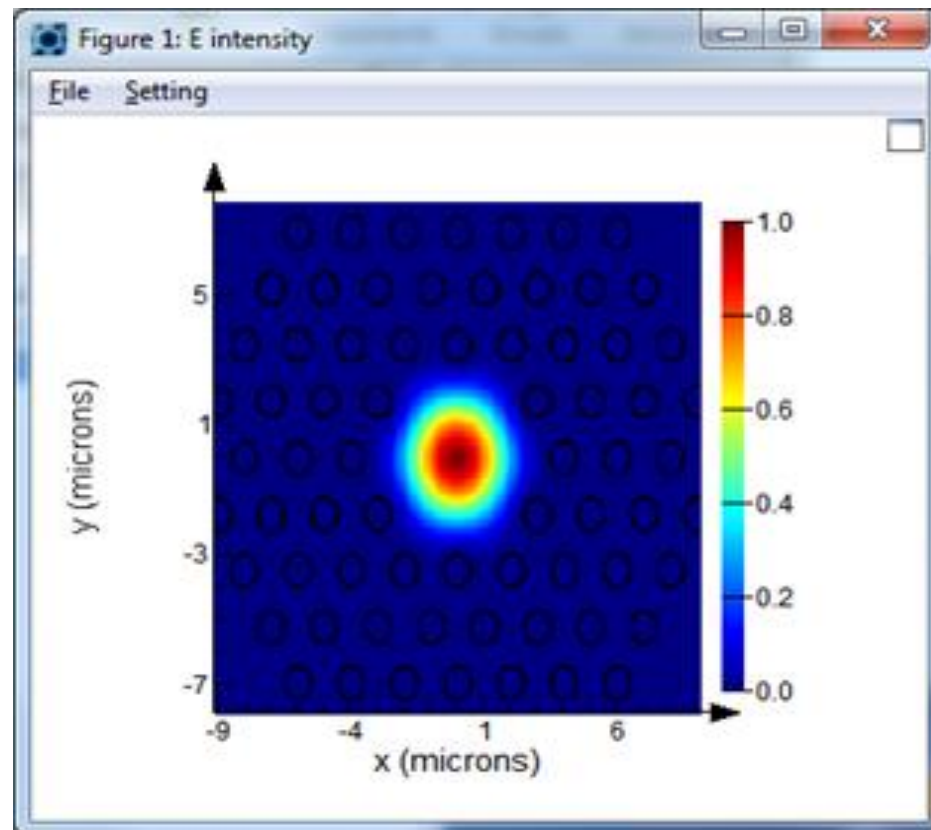

Choquette et al., "High Speed Photonic Crystal Vertical Cavity Lasers" (2011), Optical Fiber Communication Conference and Exposition (OFC/NFOEC), 2011.

Optical Simulation to predict VCSEL Modal Properties

Use a combination of tools to simulate the VCSEL modal behaviour

1. Create a model of the planar VCSEL using STACK
2. Examine transverse modes using Finite Difference Eigenmode (FDE) or Finite Element Eigenmode (FEEM) methods

- *Cavity can clearly support several modes*

3D FDTD Modelling

Set up a 3D simulation

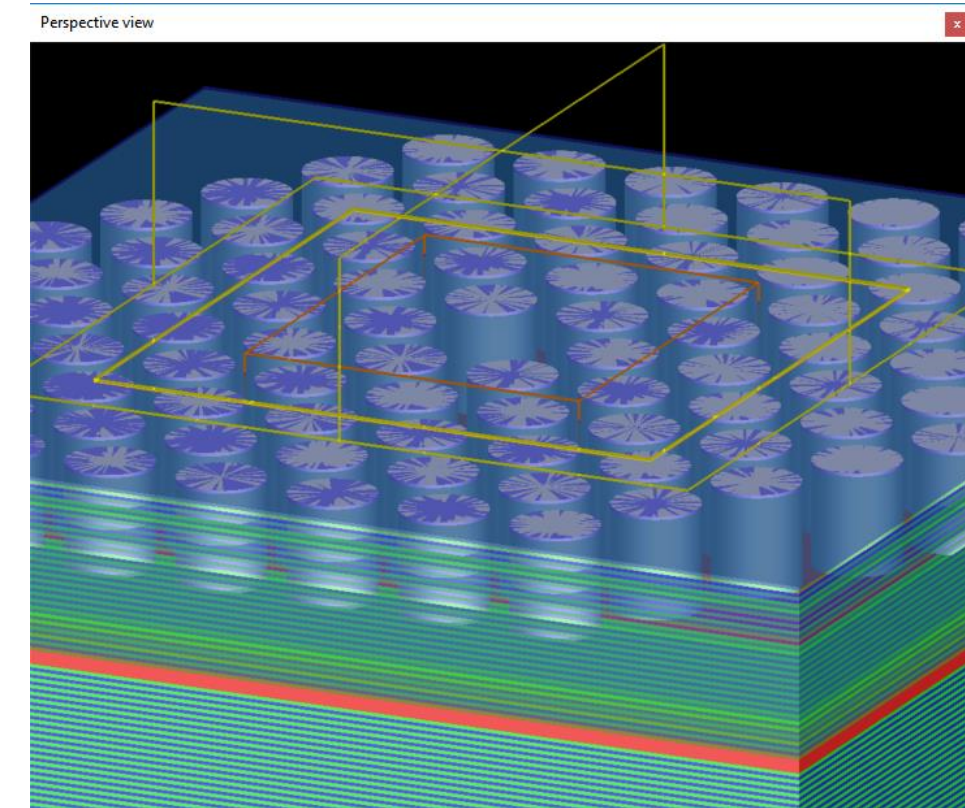

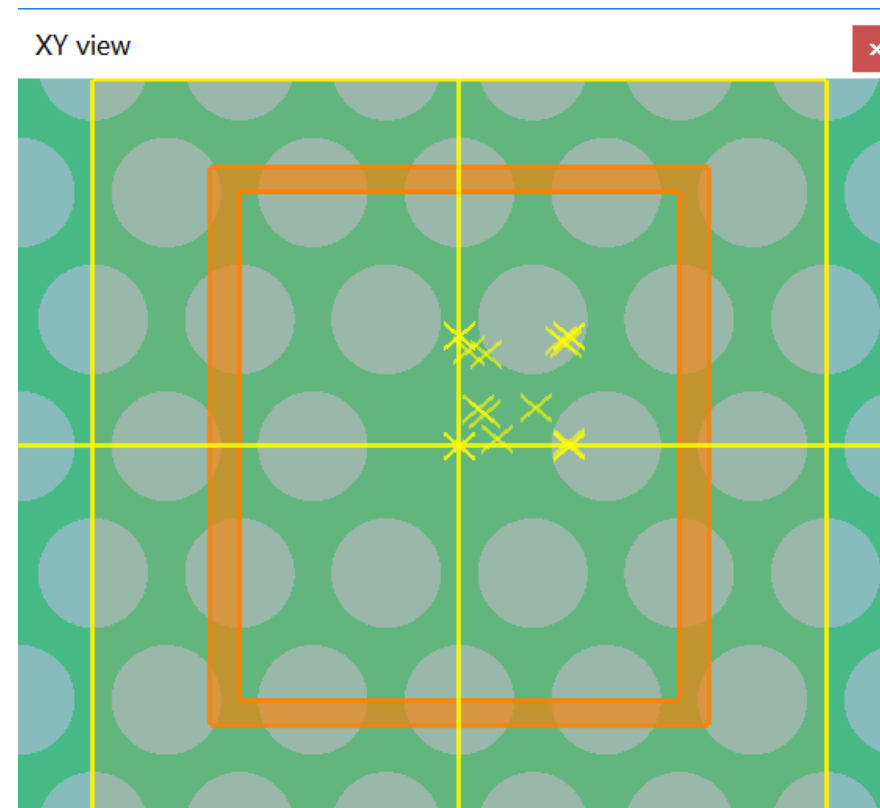

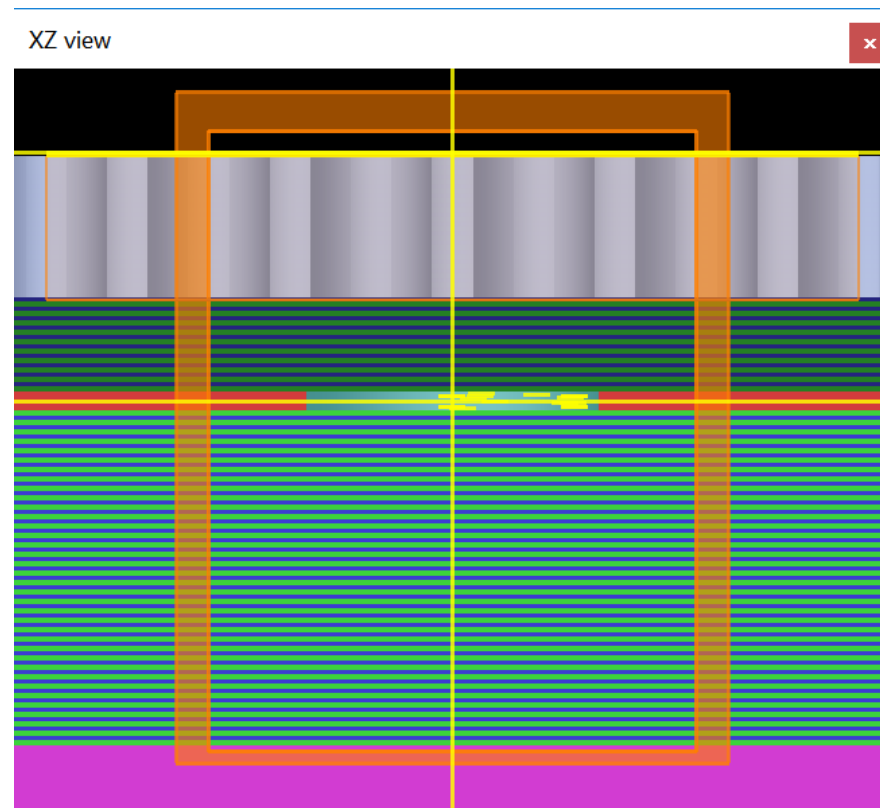

- Modal analysis of the cold cavity

Create an electrically pumped gain medium in FDTD and let the mode competition play out

- Follow evolution of modes in the cavity

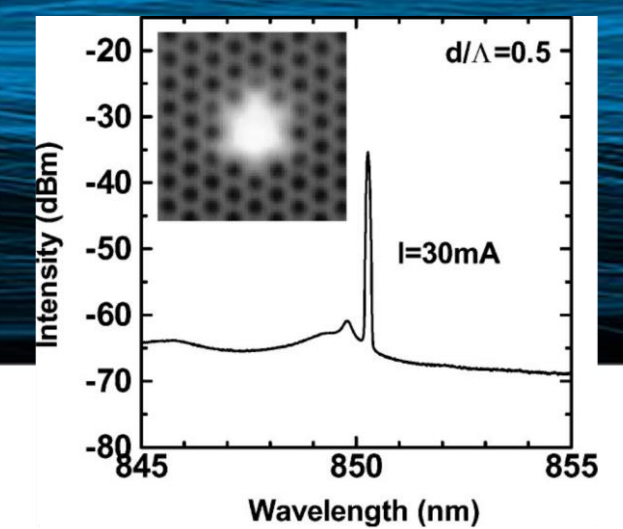

Large, long, computationally intensive 3D FDTD simulations

- Modern workstations make it quite tractable in hours to ~ 1 day on a single workstation
- HPC and clusters can go even faster

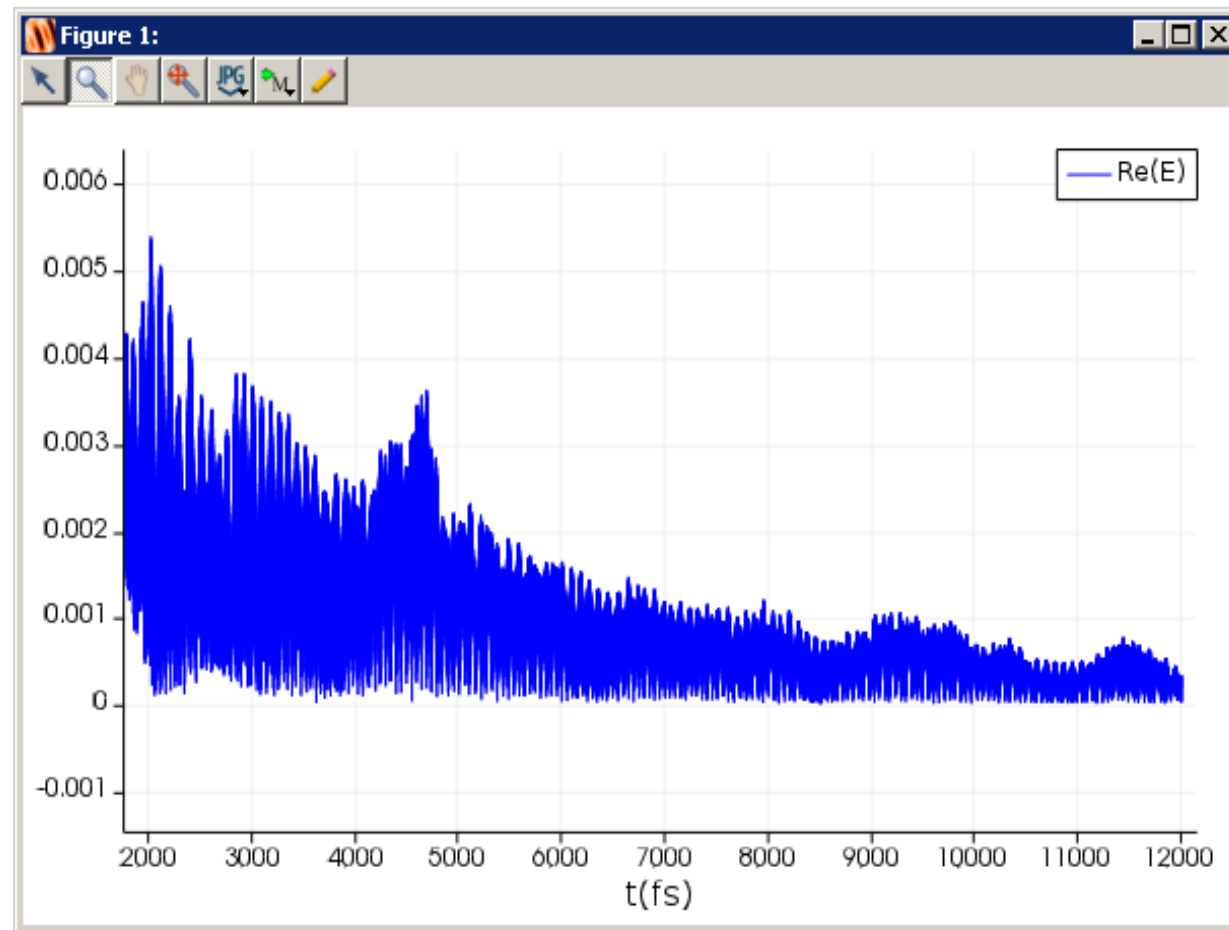

PhC VCSEL example: cold cavity with dipole sources

3. Examine the modal properties of the cold cavity

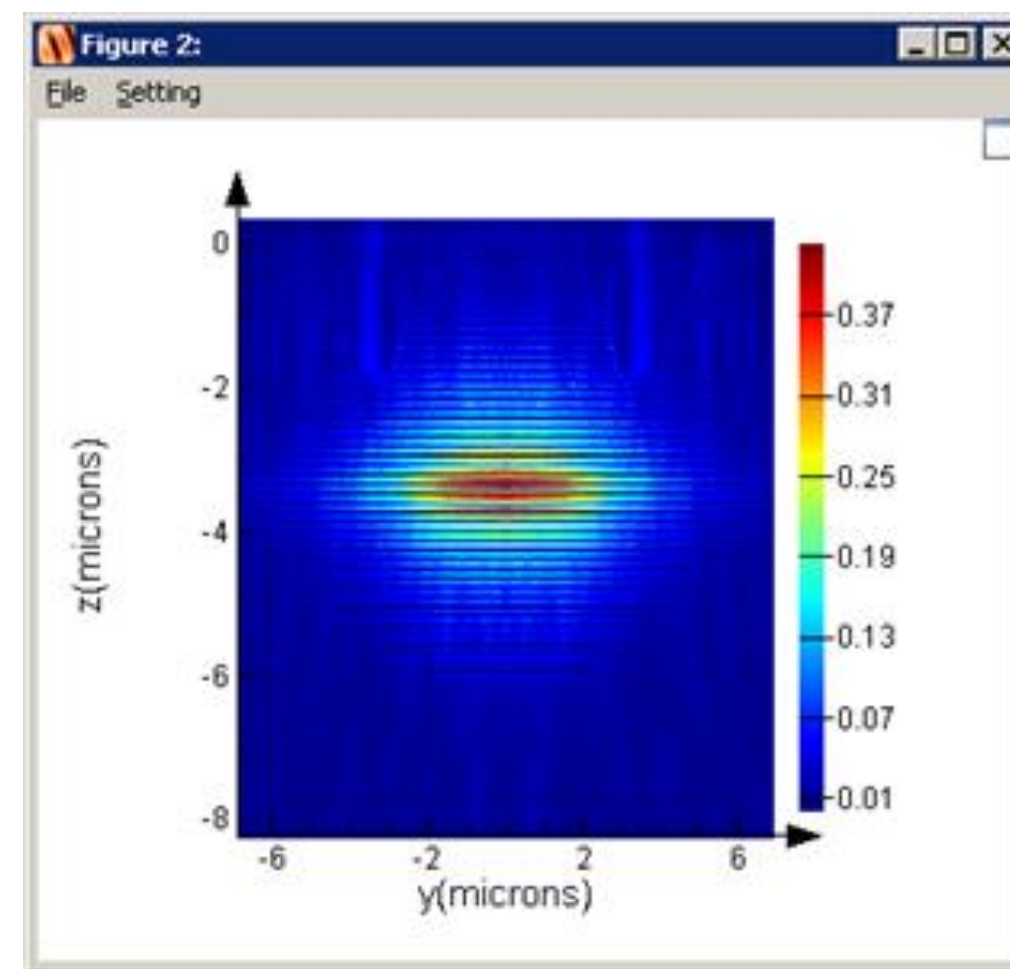

Yokouchi et al., Appl. Phys. Lett., Vol. 82, No. 21, 26 May 2003

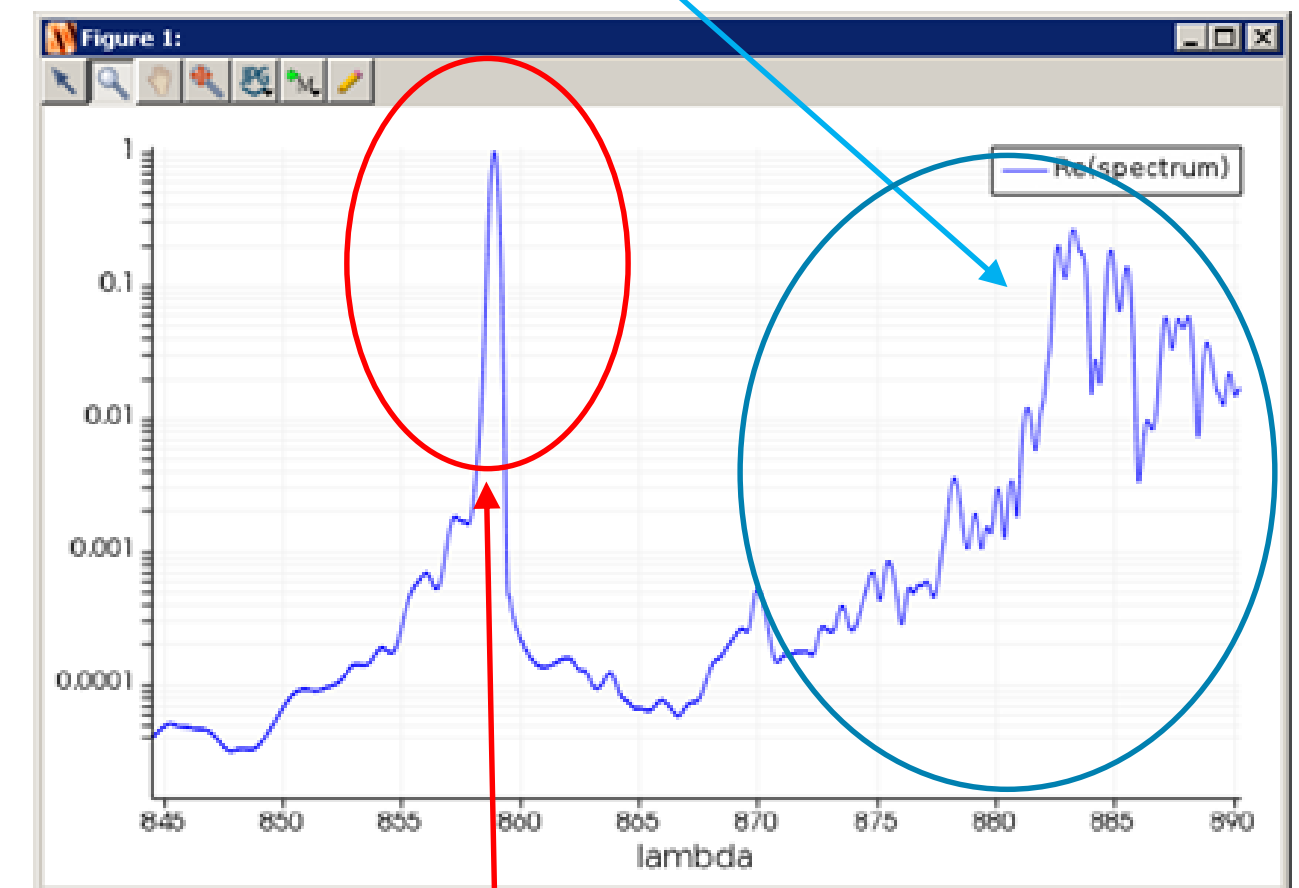

E field decay in time, with the dominant mode remaining

Mode profile

Numerical artifact due to large lateral grid to reduce simulation time (region not of interest)

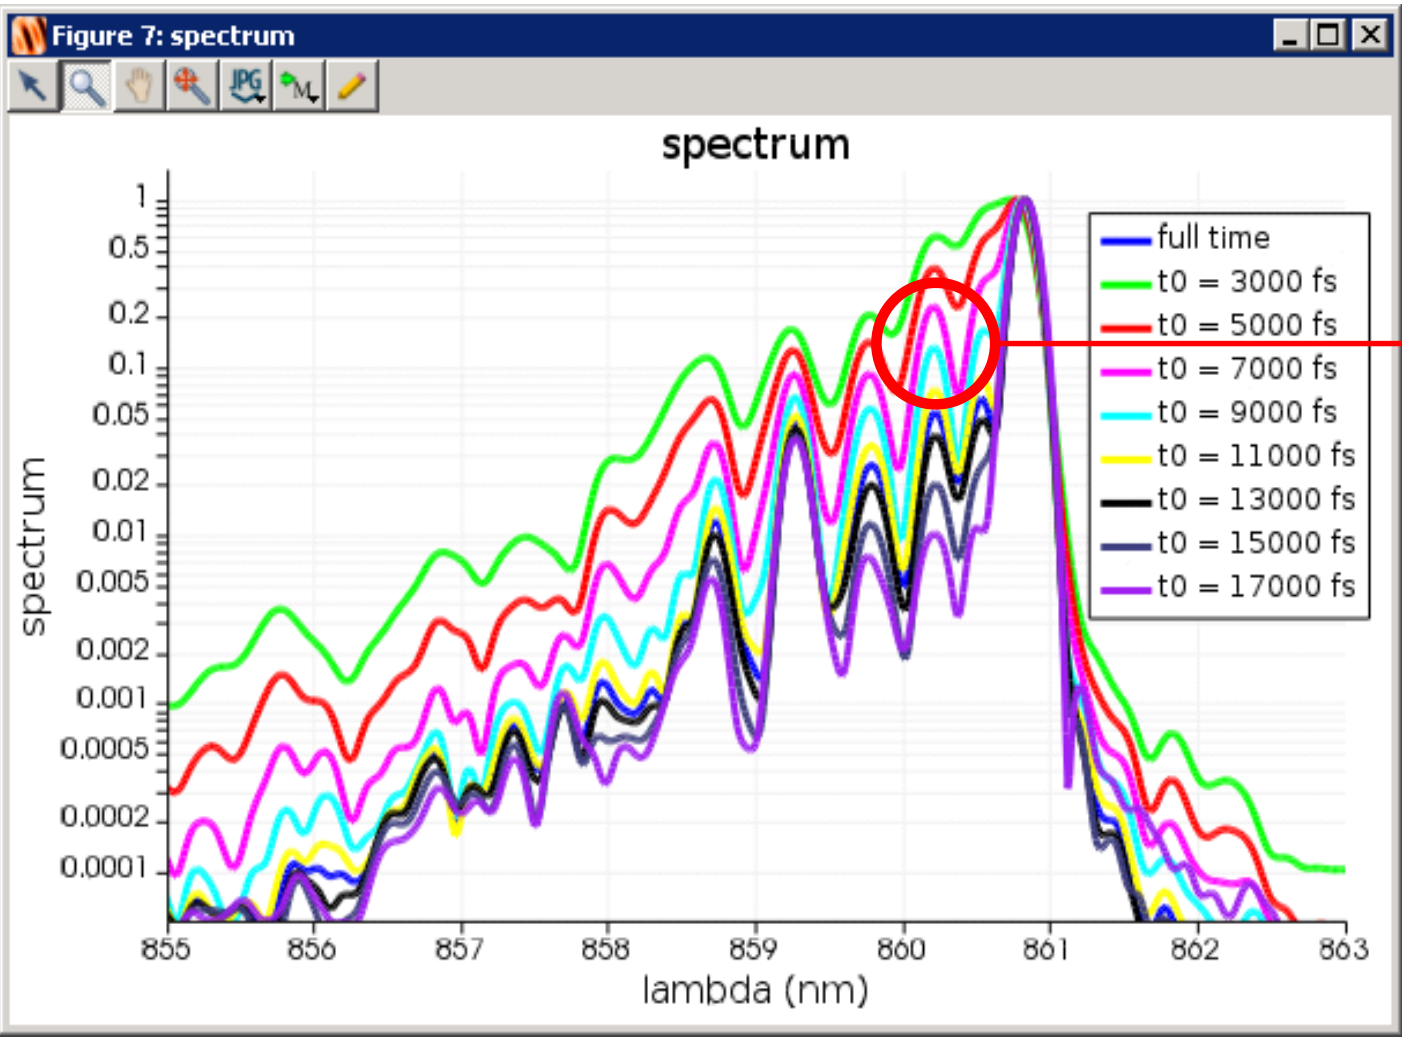

Fundamental (Laser) Mode

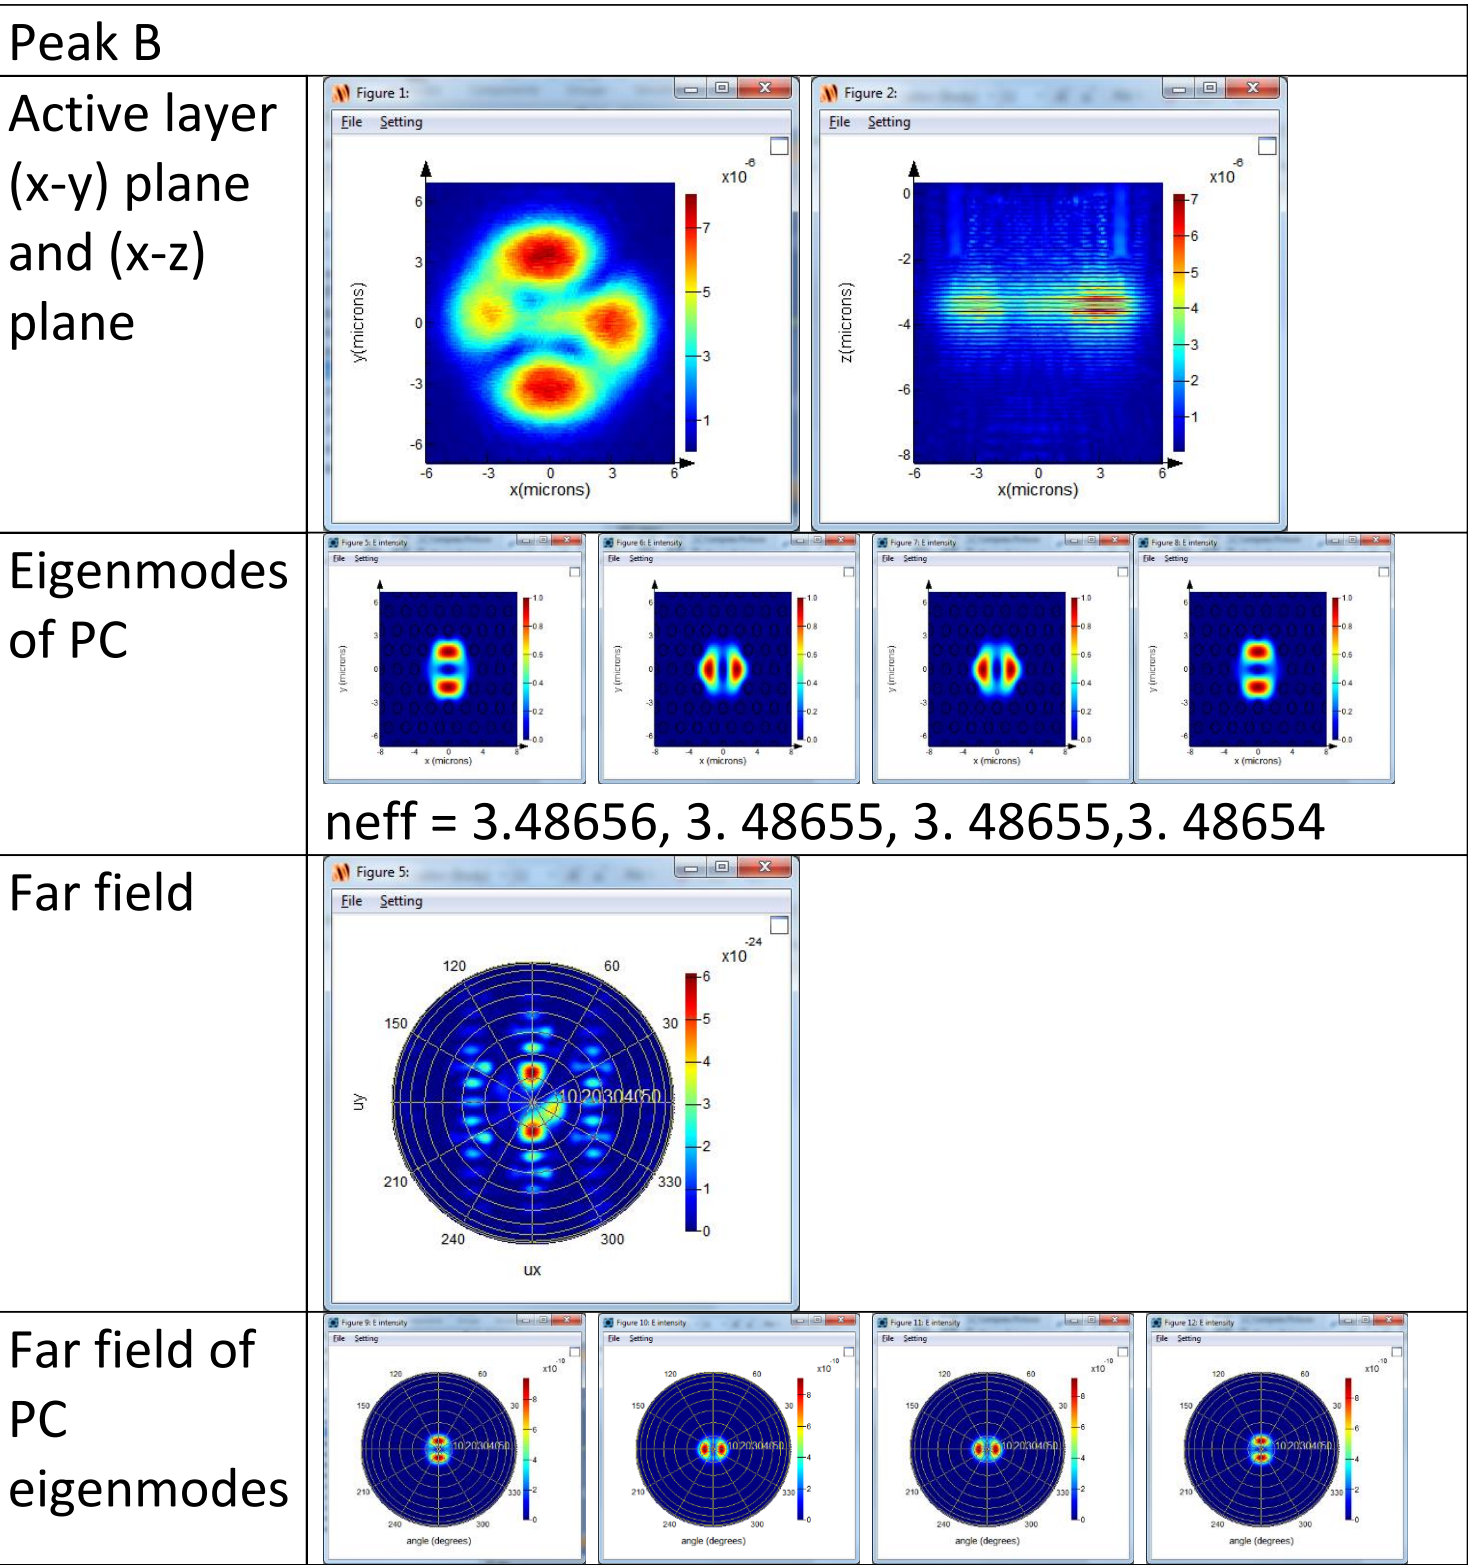

PhC VCSEL example: cavity with saturable gain active region model

4. Add gain to the model

Laser spectrum at different times

Analysis of the second most dominant mode at 7 ps

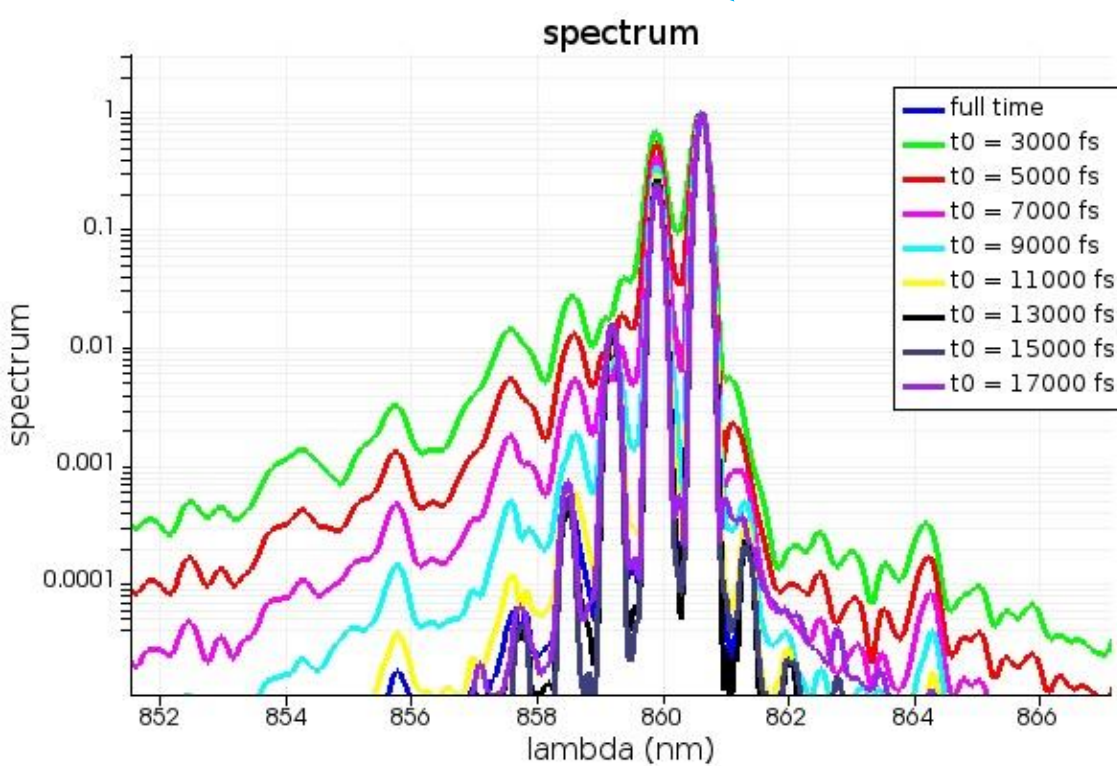

Relatively weak mode suppression ratio

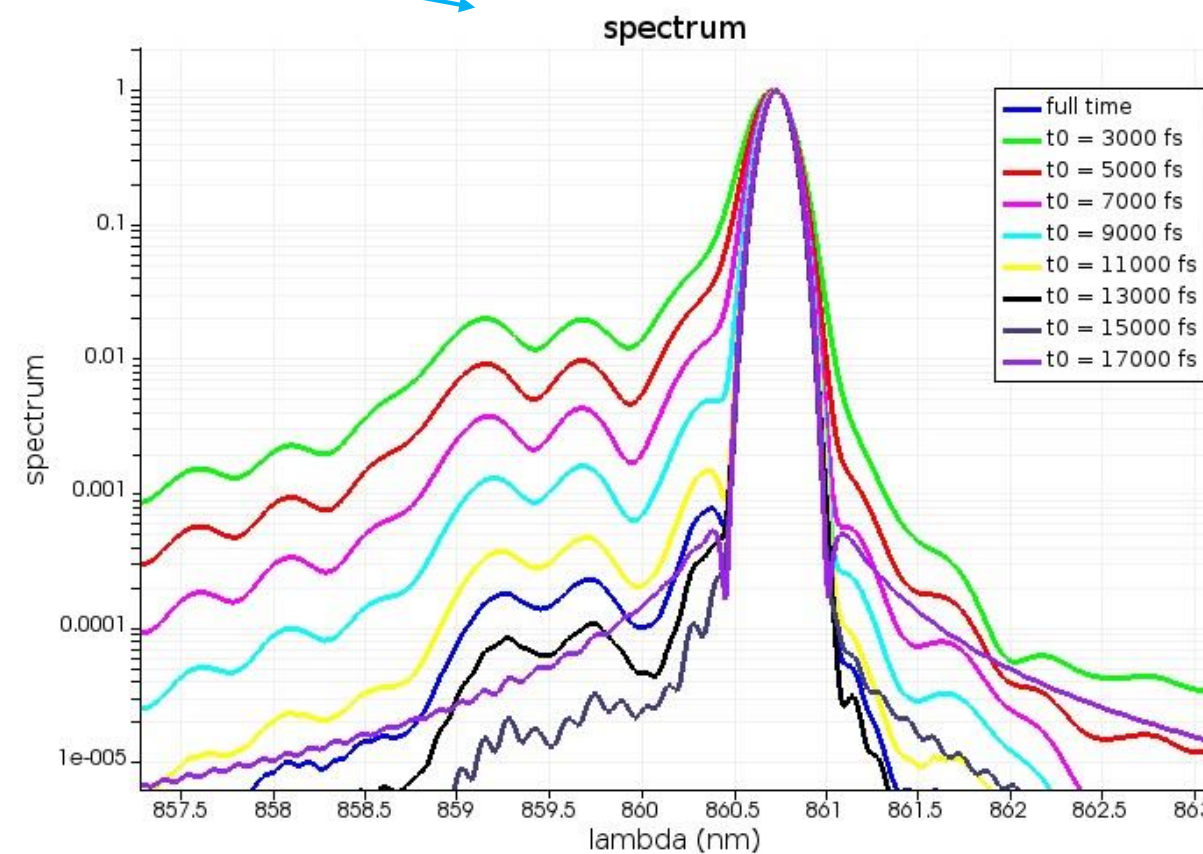

PhC – FDTD of etched DBR structures (*Choquette et al*)

FDTD simulations using 3 different etch depths

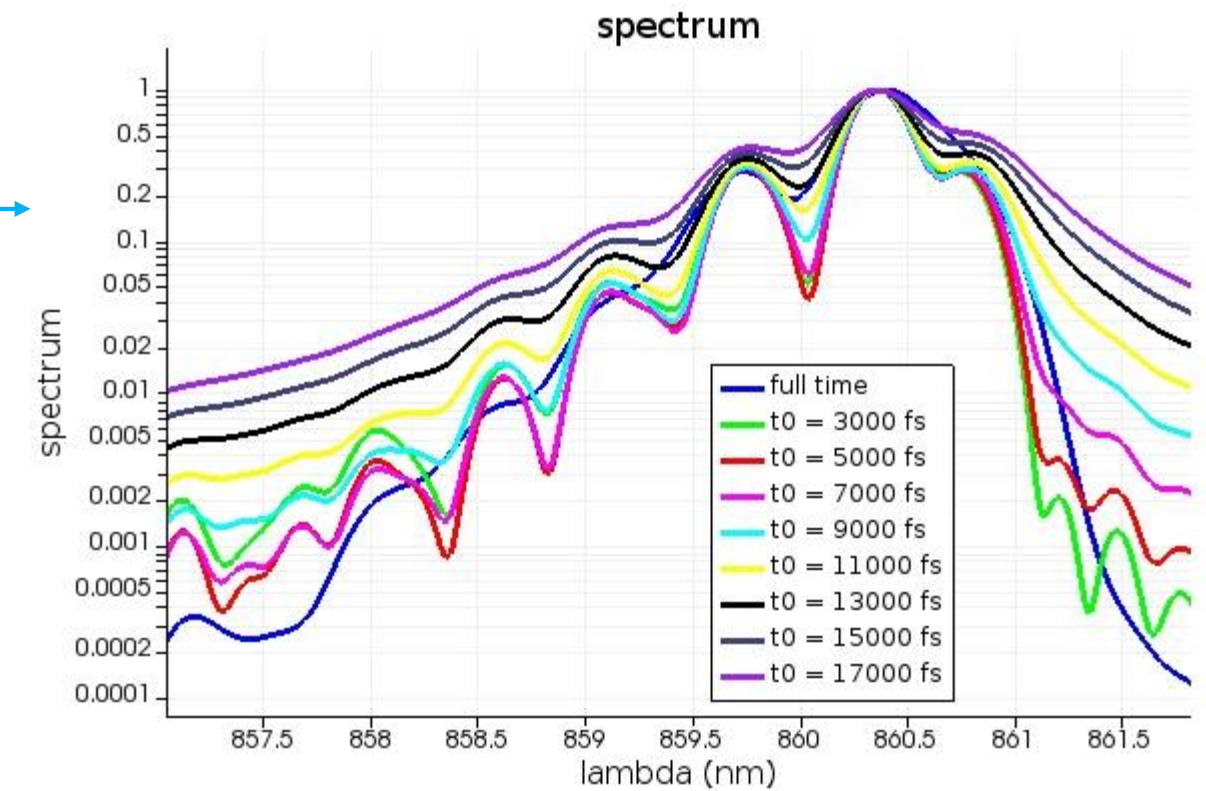

1. Shallow (10 layers, 40% of top DBR)
2. Medium (15,60%)
3. Deep (20,80%)

MM Device
Guided modes of the PhC ?

SM Device
>40dB SMSR

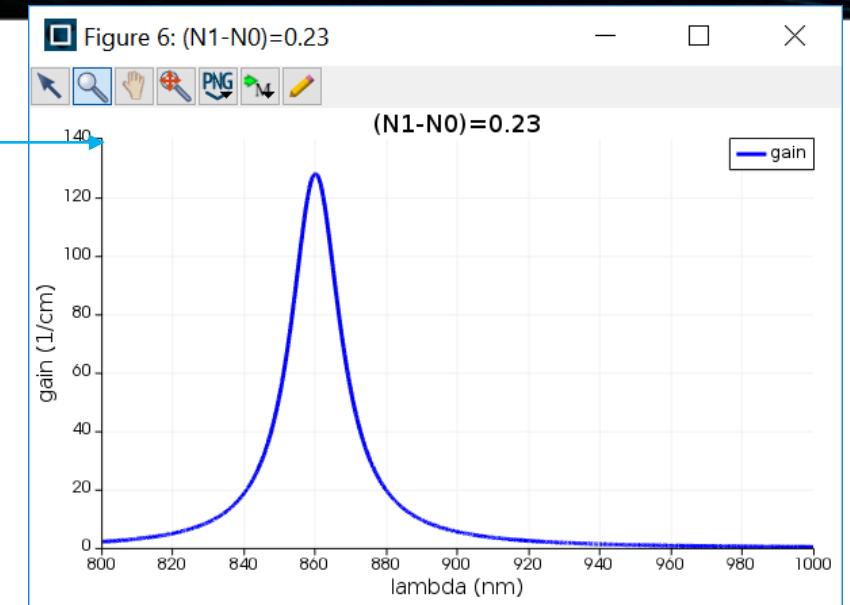

MM Device
No effect of the PhC ?

*Good qualitative agreement with
experimental results*

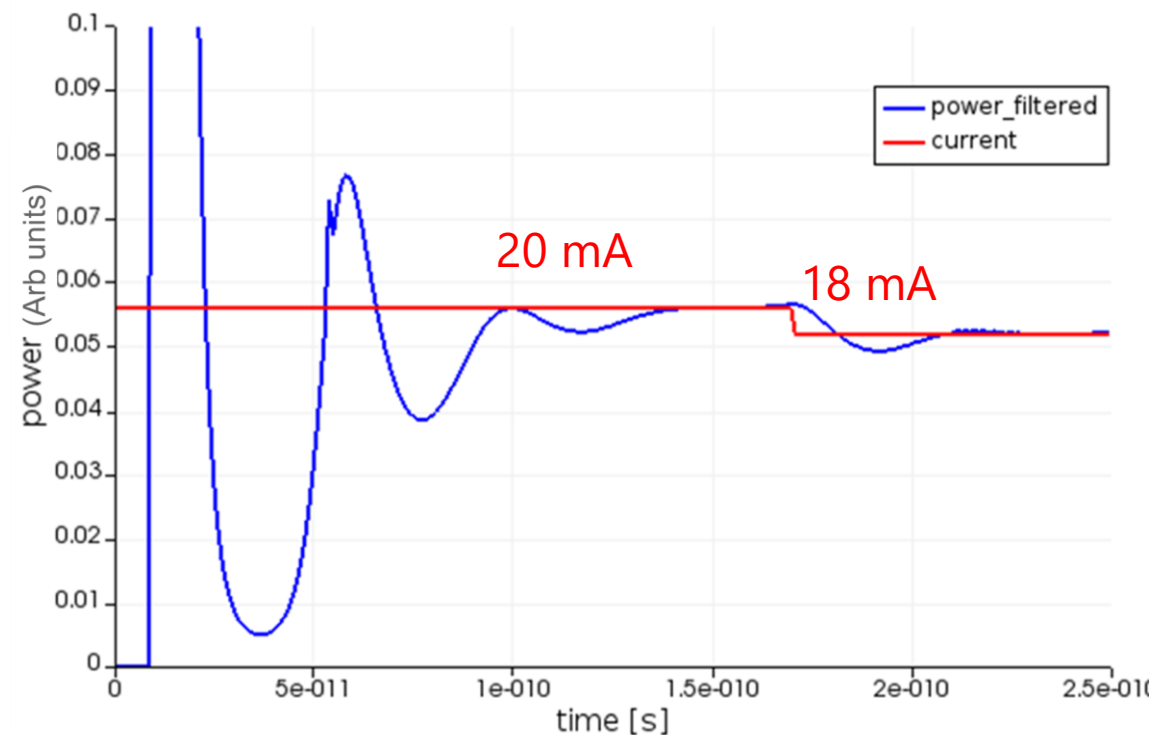

**FDTD becomes a predictive tool
for evaluating MODE behaviour
of VCSEL Structures**

3D FDTD with current driven gain model calibrated by MQW solver

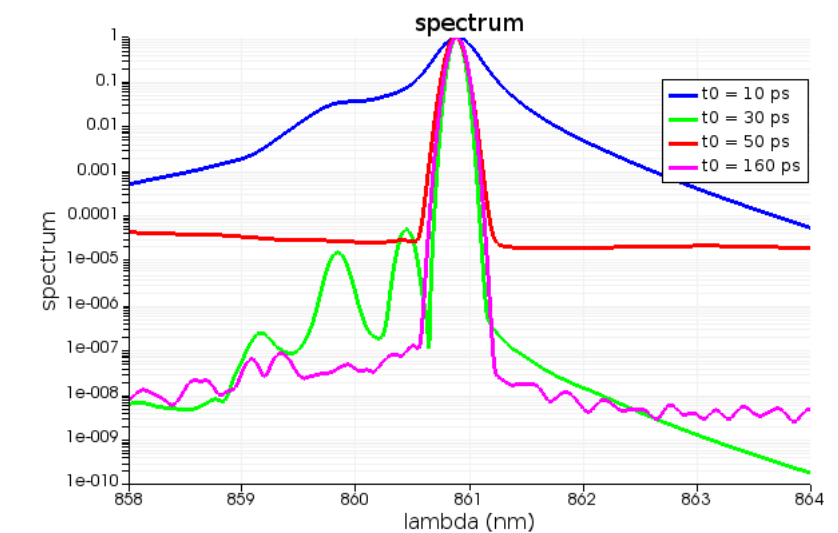

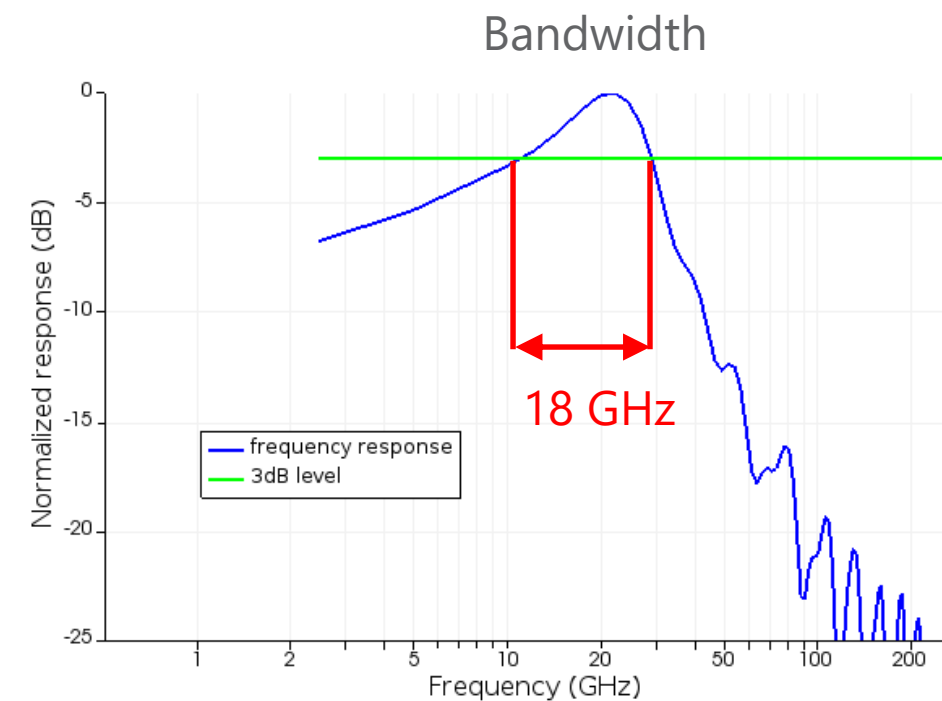

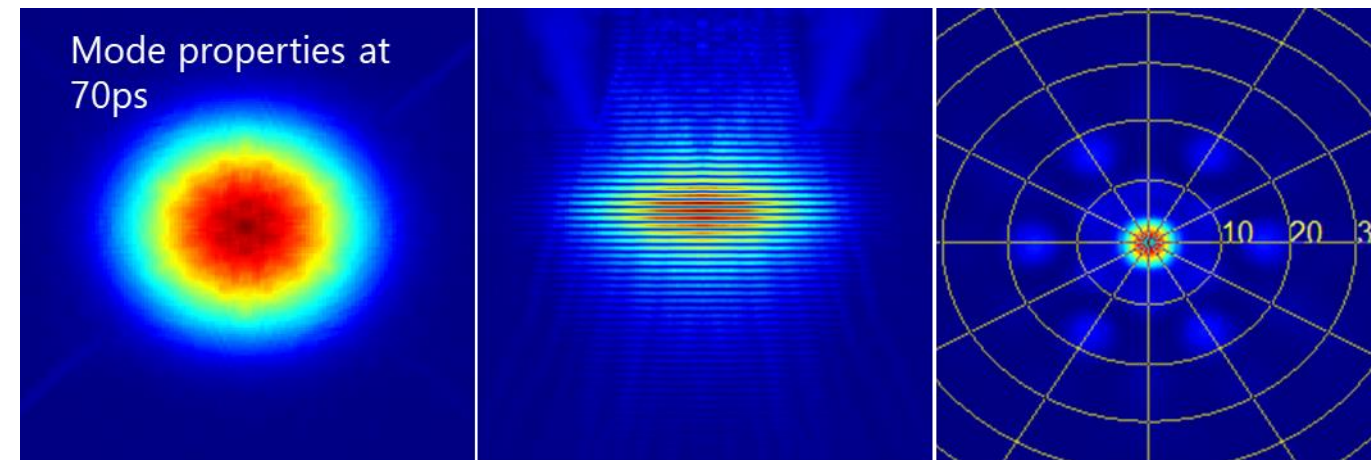

1. Calculate the active properties with MQW gain
2. Current driven gain model for FDTD that uses values calculated by MQW gain
3. To speed onset of steady state, set initial excitation density high
4. Allow current to change by small amount after steady state

Power emitted by VCSEL vs time

250ps 3D FDTD
simulations, takes ~40
hours on one
workstation

Summary and Future Work

VCSEL Modelling

- R & T Modelling
 - Characterisation tool to determine growth parameters
- Material gain, spontaneous and stimulated emission
- 3D-FDTD
 - Cold cavity
 - Transverse mode properties
 - Far field
 - Laser emission
 - Time dependent mode competition
 - Current driven gain calibrated by MQW (ongoing)

System Modelling *(Future Work)*

- Incorporate VCSEL as a component into Lumerical's INTERCONNECT
 - Variant of the TWLM
- Transceiver performance
 - Monitor response to being electrically driven
 - Eye diagrams etc...
