

Fast Optimization of Multi-Element Optic, Electro-Optic and Photonic Assemblies in Manufacturing

The Emergence of Intelligent Positioning in High-Throughput Photonics Manufacturing

About PI

- **Specialized in Nano & Micro-Positioning**
- Karlsruhe, Germany HQ
- ~1500 Employees, ~€200M Global Sales
- Founded 1970
- **>100 man years of alignment expertise**
 - Global Photonics team
 - German precision
- **Whole Range of Control Electronics**
 - Digital, Analog, High Altitude, ...
- **Global Manufacturing & Design Capability**
 - R&D/Production & Metrology Labs on 3 Continents
- **Privately Owned – Not Driven by Quarterly Results**
 - Key Decision Makers are Scientists & Engineers
 - Seek Long Term Relationships with Customers and Suppliers

PI's
Engineered Systems Group
Builds World-Class
Automation Platforms

PI's spectrum
spans the world
of ultra-precision

Alignment: The Repetitive Cost

Cost breakdown

Packaging cost is a big piece of the pie for Photonics

Microelectronic packaging is geared towards low cost

Packaging is key to lower cost of photonics

Leverage the microelectronic industry

Photonics Summit, Cadence, 6th September 2017, San Jose CA

A modular approach to meet all needs

Hexapods

Nanopositioners

Stage stacks:

- Motor-driven
- Linear motor
- Voice coil...

optical power distribution

PI's Optimization Technology

Challenges we addressed:

- Select global optimum
- Tracking
- Multiple channels, elements, DOFs which interact
- Many possible figures of merit
- Avoid implicit assumptions
 - Symmetry
 - Circularity
 - "Gaussian-ness"
 - ...

*Suitable for
Edge-coupling
or diffractive-
couplers*

PI's Novel Parallel Gradient Search

- Super fast optimization
- Tracking
- Compensation of drift
- Parallel implementations for multi-I/O, multi-element, multi-DOF single-step alignments

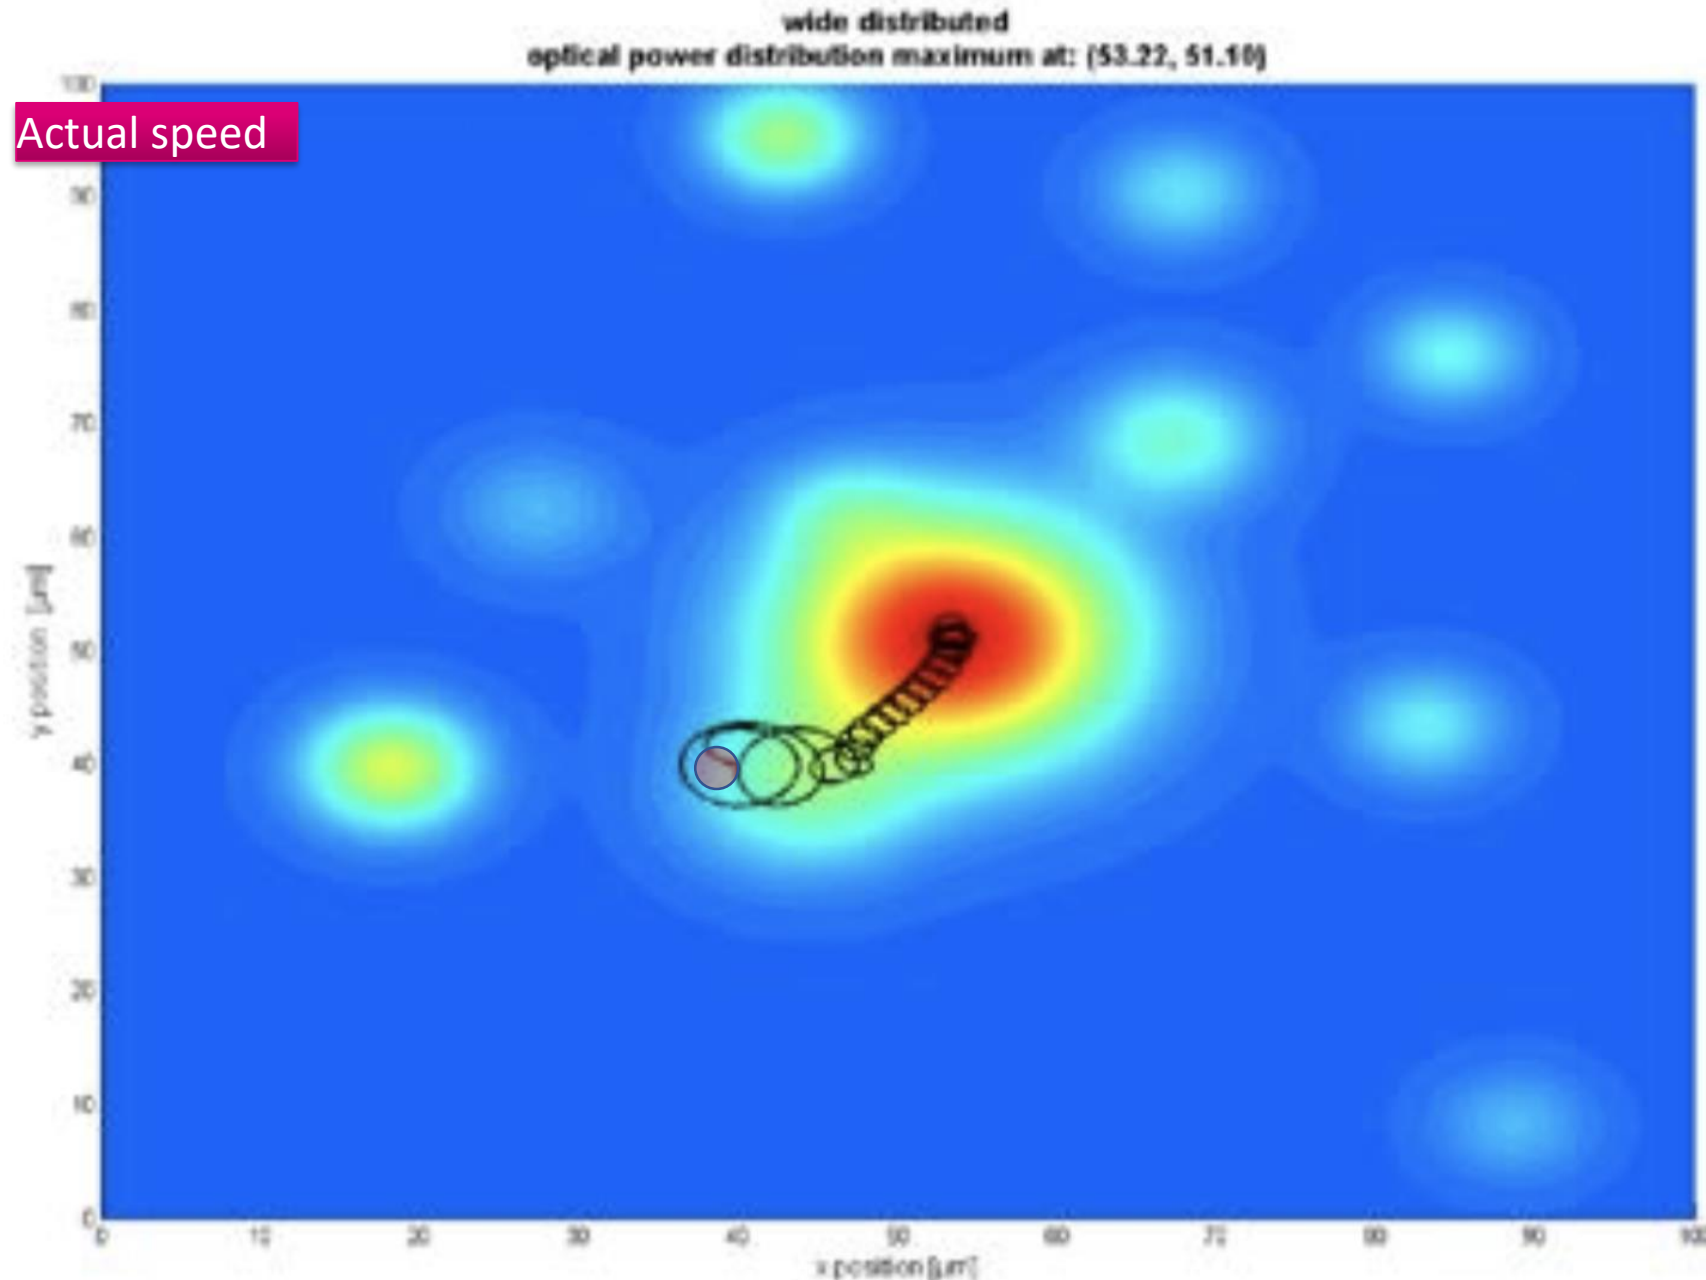

EXAMPLE:
Fast, efficient
fine optimization
...with tracking if desired

PI's Novel Parallel Gradient Search

- Super fast optimization
- Tracking
- Compensation of drift
- Parallel implementations for multi-I/O, multi-element, multi-DOF single-step alignments

EXAMPLE:
Fast, efficient
fine optimization
...with tracking if desired

How it works

- θ_{dither} is the instantaneous phase of the physical dither
- $\theta_{\text{dither}}(t) = F_{\text{dither}} \cdot t$
- Error signal $\epsilon(\theta)$ is ~sinusoidal
- Input and output alignment dithers are additive at the power meter, as are channel combinations
 - We cracked the math for separating these, enabling parallel, multichannel alignments

PI's groundbreaking FMPA algorithm allows simultaneous alignment of all inputs and outputs and all DOFs.

This is something new.
And essential.

An Aha!

...About that metrology...

- Most photonic applications want to optimize optical throughput
 - There are exceptions
- More broadly, many positioning applications involve hill-shaped *figures of merit* or *quality criteria* as functions of position!
 - Manufacturing a laser
 - Power, modal purity, linewidth, etc.
 - Building a camera
 - "Image quality" ...*MTF*, *2DFFT*, etc.

This technology is metrology-agnostic.

This technology maps to broad manufacturing challenges!

"Adaptive software eases camera lens-to-sensor alignment", J. Roe, A Israeli, Laser focus World, 3/2013

Parallelism: Key to Process Economics

Parallelism is the enemy of time-consuming loops

Loops formerly required because Optimization 1 would mess up Optimization 2, and so on

- **Array devices dominate PICs**
- Multiple input/outputs... lots of them
- Bleeding-edge example: Chiral Photonics PROFA
 - To >90 channels, to 10 micron pitch
- Traditional alignment loop:
 1. Align XY
 2. Make small theta-Z adjustment
 3. Go to 1

...Several minutes to complete
- Or:

Parallelism to optimize XY & theta-Z in one step

Chiral Photonics

Parallelism in Action
