**How this
information
could be used
to overcome
the challenge
of laser
damage?**

**Gain
knowledge
where to
look!**

Trial → Error + Feedback

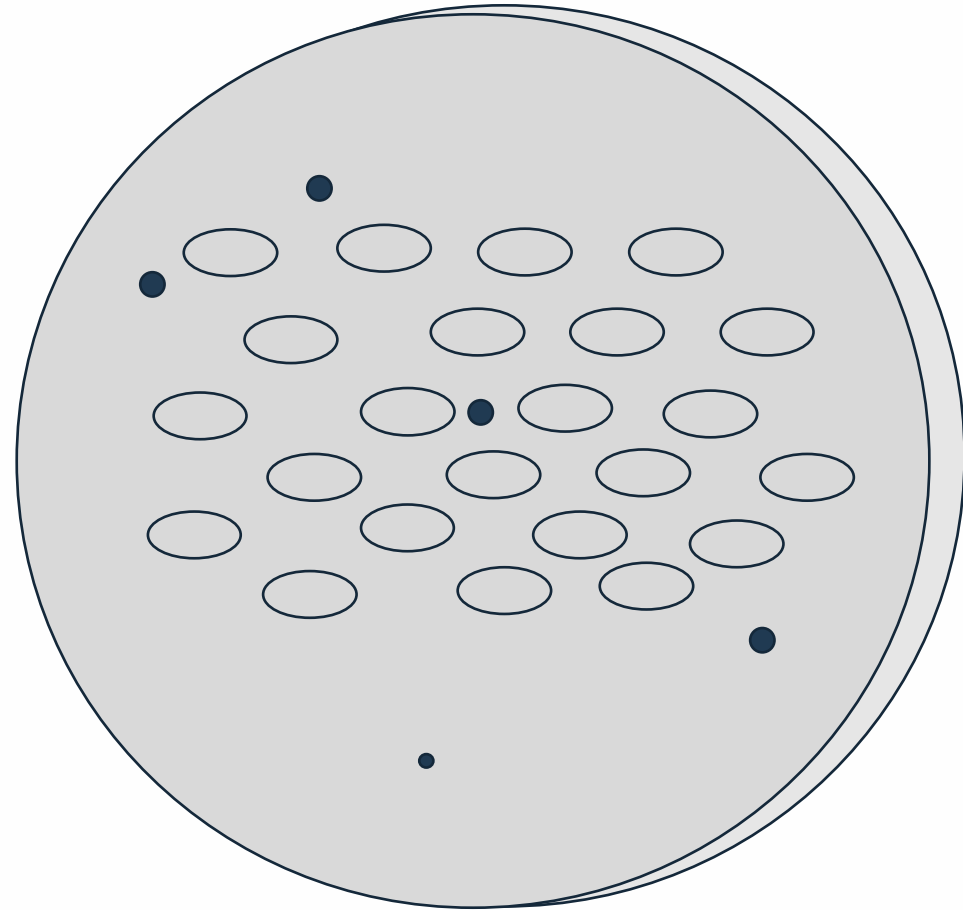

**Testing: quality
feedback**

**Parameters
optimization**

RARE DEFECT DRIVEN DAMAGE

Standard statistical testing methods might not always be repeatable

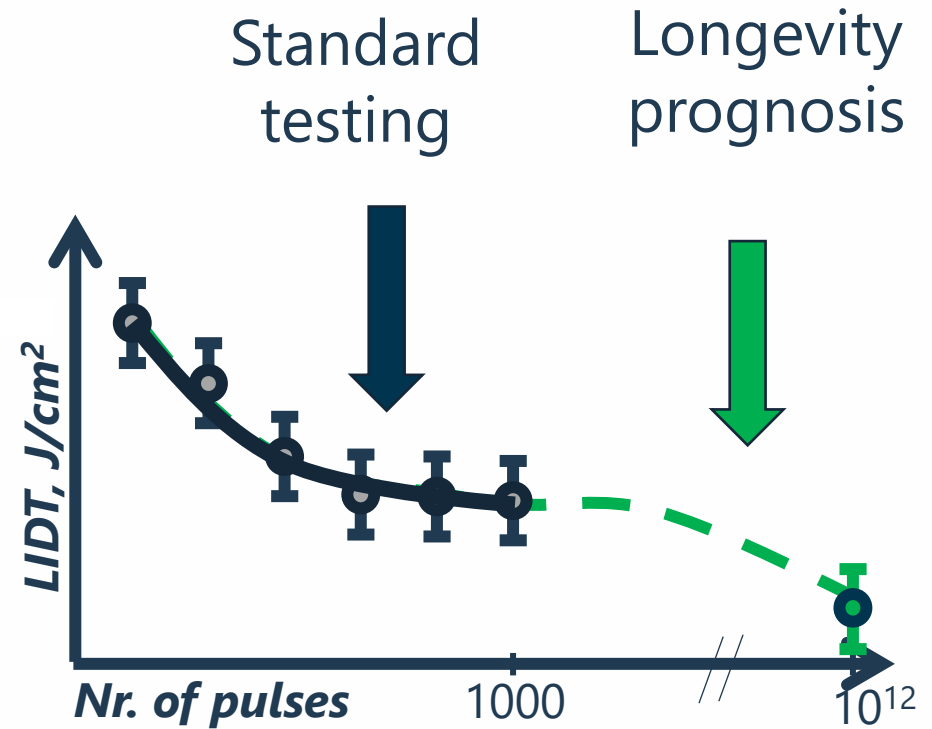

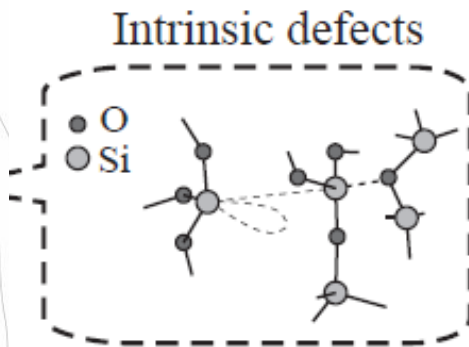

RARE DEFECT DRIVEN DAMAGE

Extrinsic defects

Other testing procedures such as raster scan should be applied.

FATIGUE DRIVEN DAMAGE

WHAT WE CAN DO AT LIDARIS

Wide assortment of LIDT testing condition

1-ON-1

S-ON-1

R-ON-1

Certification

Raster Scan

WHAT YOU CAN DO FOR US

Routine testing of the optical elements

Share your LIDT problems: DOE approach to optimize their optical elements, understanding specific cases, RnD possibilities

Stable lasers, quality optical elements

Epic Online Technology Meeting on Challenges For Laser Optics

Vienas iš challenge yra pazeidimas
Pazeidimas suprantamas per siautai: kaip vienas kaicius

Pazeidimas gali būti nulemtas defektu arba senėjimo: degradavimo

Lidaris supranta tokias problemas ir gali padėti jums panaudoti tas žinias

Projektas su optoman dėl ilgalaiskiskumo

Ka galima daryti tokiais: atvejais?

Galima gerinti technologijas, bet tam reikia gero grįžamojo ryšio

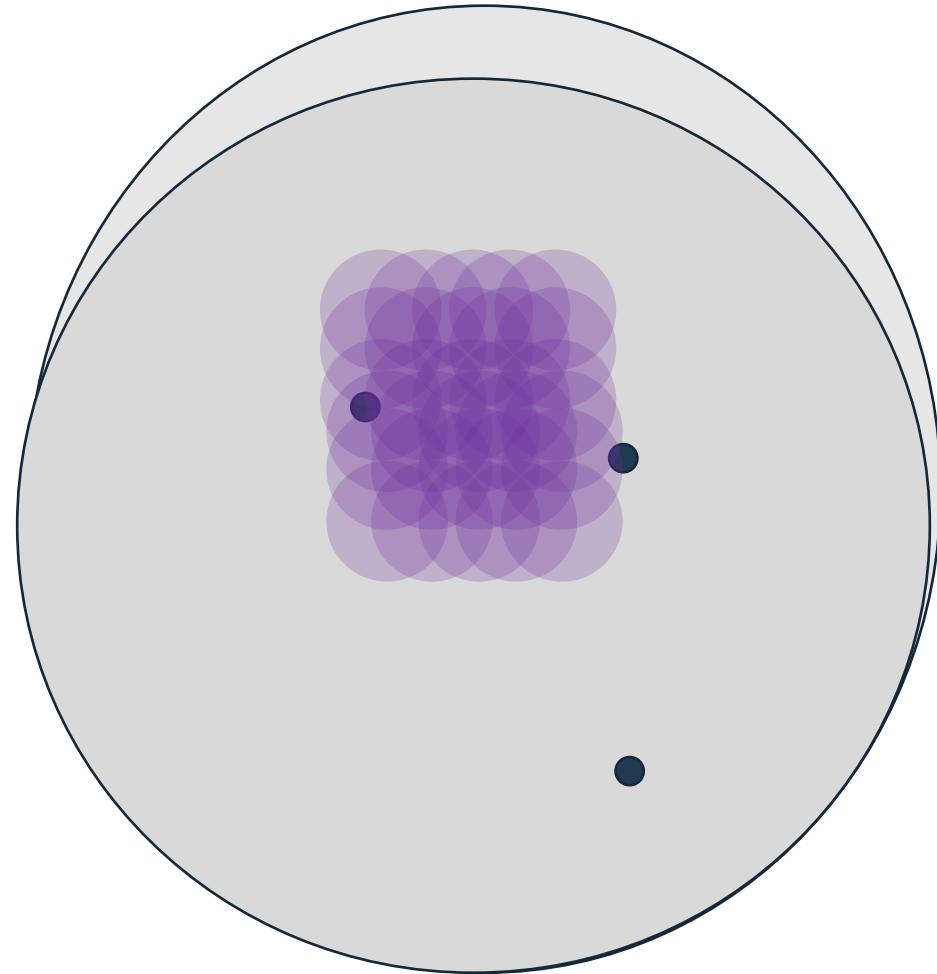

Jei svarbu senėjimas: tada prognozavimas

Jei dirbama su didesniu apreturu optika: defektu gaudymas (raster scan)

Laser damage characterization

THERE ARE DIFFERENT WAYS HOW TO BREAK OPTICAL ELEMENT

1-on-1

S-on-1

R-on-1

Raster scan

Laser damage characterization

RASTER SCAN PROCEDURE

1. A fresh unexposed area of $0,9 \text{ cm}^2$ was selected
2. Fluence value is preset
3. Area raster scanned with 90% overlapping beam at $1/e^2$ intensity level

Laser damage characterization

RASTER SCAN PROCEDURE

1. A fresh unexposed area of 0,9 cm² was selected
2. Fluence value is preset
3. Area raster scanned with 90% overlapping beam at 1/e² intensity level
4. Surface of the sample is inspected under Nomarki microscope.

Damage was found to be initiated by defects (nodular or other type defects) located on the sample surface

Laser damage characterization

RASTER SCAN PROCEDURE

1. A fresh unexposed area of $0,9 \text{ cm}^2$ was selected
2. Fluence value is preset
3. Area raster scanned with 90% overlapping beam at $1/e^2$ intensity level
4. Surface of the sample is inspected under Nomarki microscope
5. Fluence is increased and the same procedure is repeated again.
