EPIC: NEW MEDICAL DEVICES MAKING THE IMPOSSIBLE POSSIBLE

## A world leader in technology & service innovation

- We develop “first of kind” systems or rapid speed to market with:
  - Market leading performance
  - Reduced time-to-market & reduced risk
  - Valuable IP our clients can own
- 70% of our work is repeat business – we become **trusted partners** to our clients
- Over **60 years'** history of product development and technology innovation

## Facilities to nurture breakthroughs

- Over 100 world-class labs across 20,000sqm of delivery facilities
- Our team comprises over 900 engineers, scientists and designers,
- Latest tools and facilities for world class development, distributed across six locations around the globe

## Chip-on-tip endoscope

OmniVision OV6946 “chip-on-tip” 400 x 400 pixel sensor (0.9mm x 0.9mm)

4 glass fibres pipe  
light from an LED in  
the handle to the tip

No need for external  
processing, all electronics  
and illumination  
contained in the handle

1.35mm outer diameter  
flexible scope

## Screening neuropathy from retinal images using Deep-Learning

Diabetes is a significant health problem globally. Peripheral neuropathy (PN) is a common complication that can result in disability due to foot ulceration and amputation.

We hypothesized that PN could be identified from retinal images. Our results indicate that it is possible to predict the presence or absence of diabetic neuropathy from retinal images alone using deep-learning.

Neuropathy diagnosis, binary, best model: AUC:  $0.763 \pm 0.051$
