CETEMAS

CENTRO TECNOLÓGICO FORESTAL Y DE LA MADERA

What is CETEMAS?

A private, not-for-profit organization. We help to generate knowledge to be applied in development and sustainable management, which is fundamental to society, industry and the environment.

1. Sustainable forestry production
2. Forest planning and organisation
3. Geomatics
4. Construction and sustainable materials
5. Bioproducts

European digital strategy

Digital technologies are crucial for the EU to become climate neutral by 2050, the goal set in the European Green Deal.

- ✓ Take advantage of AI, 5G, cloud and edge computing and IoT (Internet of Things)
- ✓ Support automated and connected transport

Forest management and planning tools: the data revolution

Sensors at CETEMAS

We integrate data from different types of sensors into our solutions: satellites, drones, ground sensors (IoT), LiDAR, thermal, multispectral...

Drones

Satellites

LiDAR

TLS

Multispectral

Thermal

Main lines of work/research

PHOTOGRAMMETRY

Orthomosaics

Photogrammetric point clouds

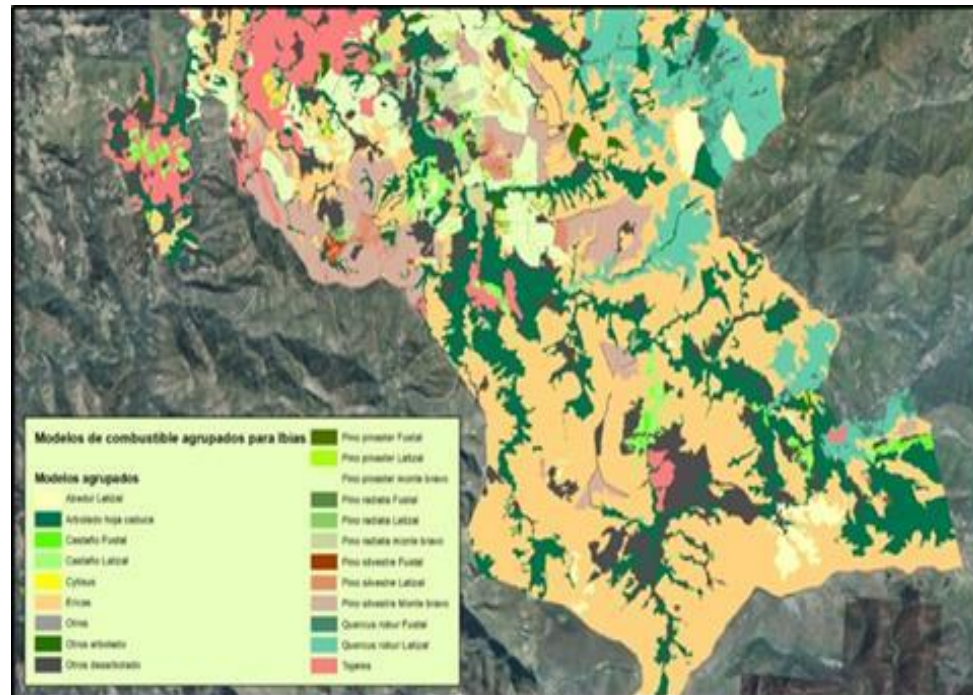

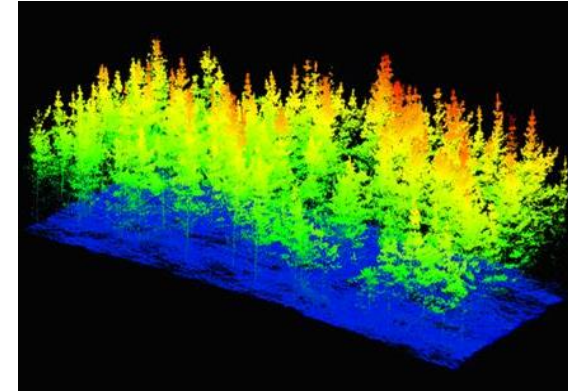

Vegetation index maps

LiDAR

Estimation of forest variables

- Trees height
- Wood volume
- Fire fuel maps

What was the objective of the tool?

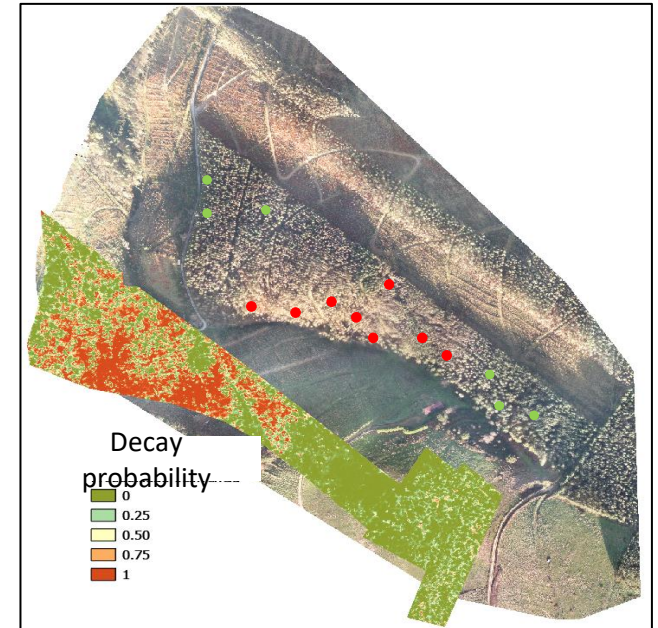

To convert a vegetation index map into a decay probability map for **Brown spot needle blight** and integrate it into a cartographic management tool

How?

$$NDVI = \frac{(NIR - RED)}{(NIR + RED)}$$

$$p = \frac{e^{19,809 - 30,568 \cdot NDVI}}{1 + e^{19,809 - 30,568 \cdot NDVI}}$$

- Healthy vegetation samples
- Unhealthy vegetation samples

How did the tool perform in other areas?

Validation area 1

Validation area 2

The next challenges

- Improving the current tool by capturing more data from decaying trees so more samples are available to feed it.
- Introducing data captured with a thermal sensor in the model
- Calibrating the model to use it with satellite images (Scalable)
- Incorporating new models for different pests and species
