# PARTNERSHIPS ACROSS THE VALUE CHAIN CREATING DE FACTO INDUSTRY STANDARD

# EVENT-BASED VISION - INTELLIGENCE IN EACH PIXEL

In Prophesee's Event-Based sensor, **each pixel operates autonomously**, responding to what it sees and detects in the scene.

This pixel level sensing method enables the acquisition of **only and all essential motion and change information, continuously and efficiently.**

*Only essential information for ultra-low power and real-time Machine Vision and AI at the Edge*

Image sensors rely on century-old paradigm. Invented by humans, for human consumption.

*"We are showing movies to machines, who are not equipped to properly comprehend them".*

FRAME - BASED

- “Beautiful” pictures for human consumption
- Fixed amount of data: redundancy and high-power consumption
- Sequential static pictures (10-30ms typical time resolution)
- Clock-driven (pre-defined frame rate)
- Needs exposure times (motion blur)
- Limited dynamic range (60dB), high dependency on lighting

EVENT - BASED

**10-1000x**  
Less data

**1,000x**  
Faster

**10-100x**  
Less power

- Essential motion information for edge computer vision and AI
- Amount of data adapts with scene, minimizing power consumption
- Time-continuous contrast detection events (1 $\mu$ s time resolution)
- Scene-driven (adaptive asynchronous pixel operation)
- No exposure time (blur free)
- High dynamic range (>120dB), no dependency on lighting conditions

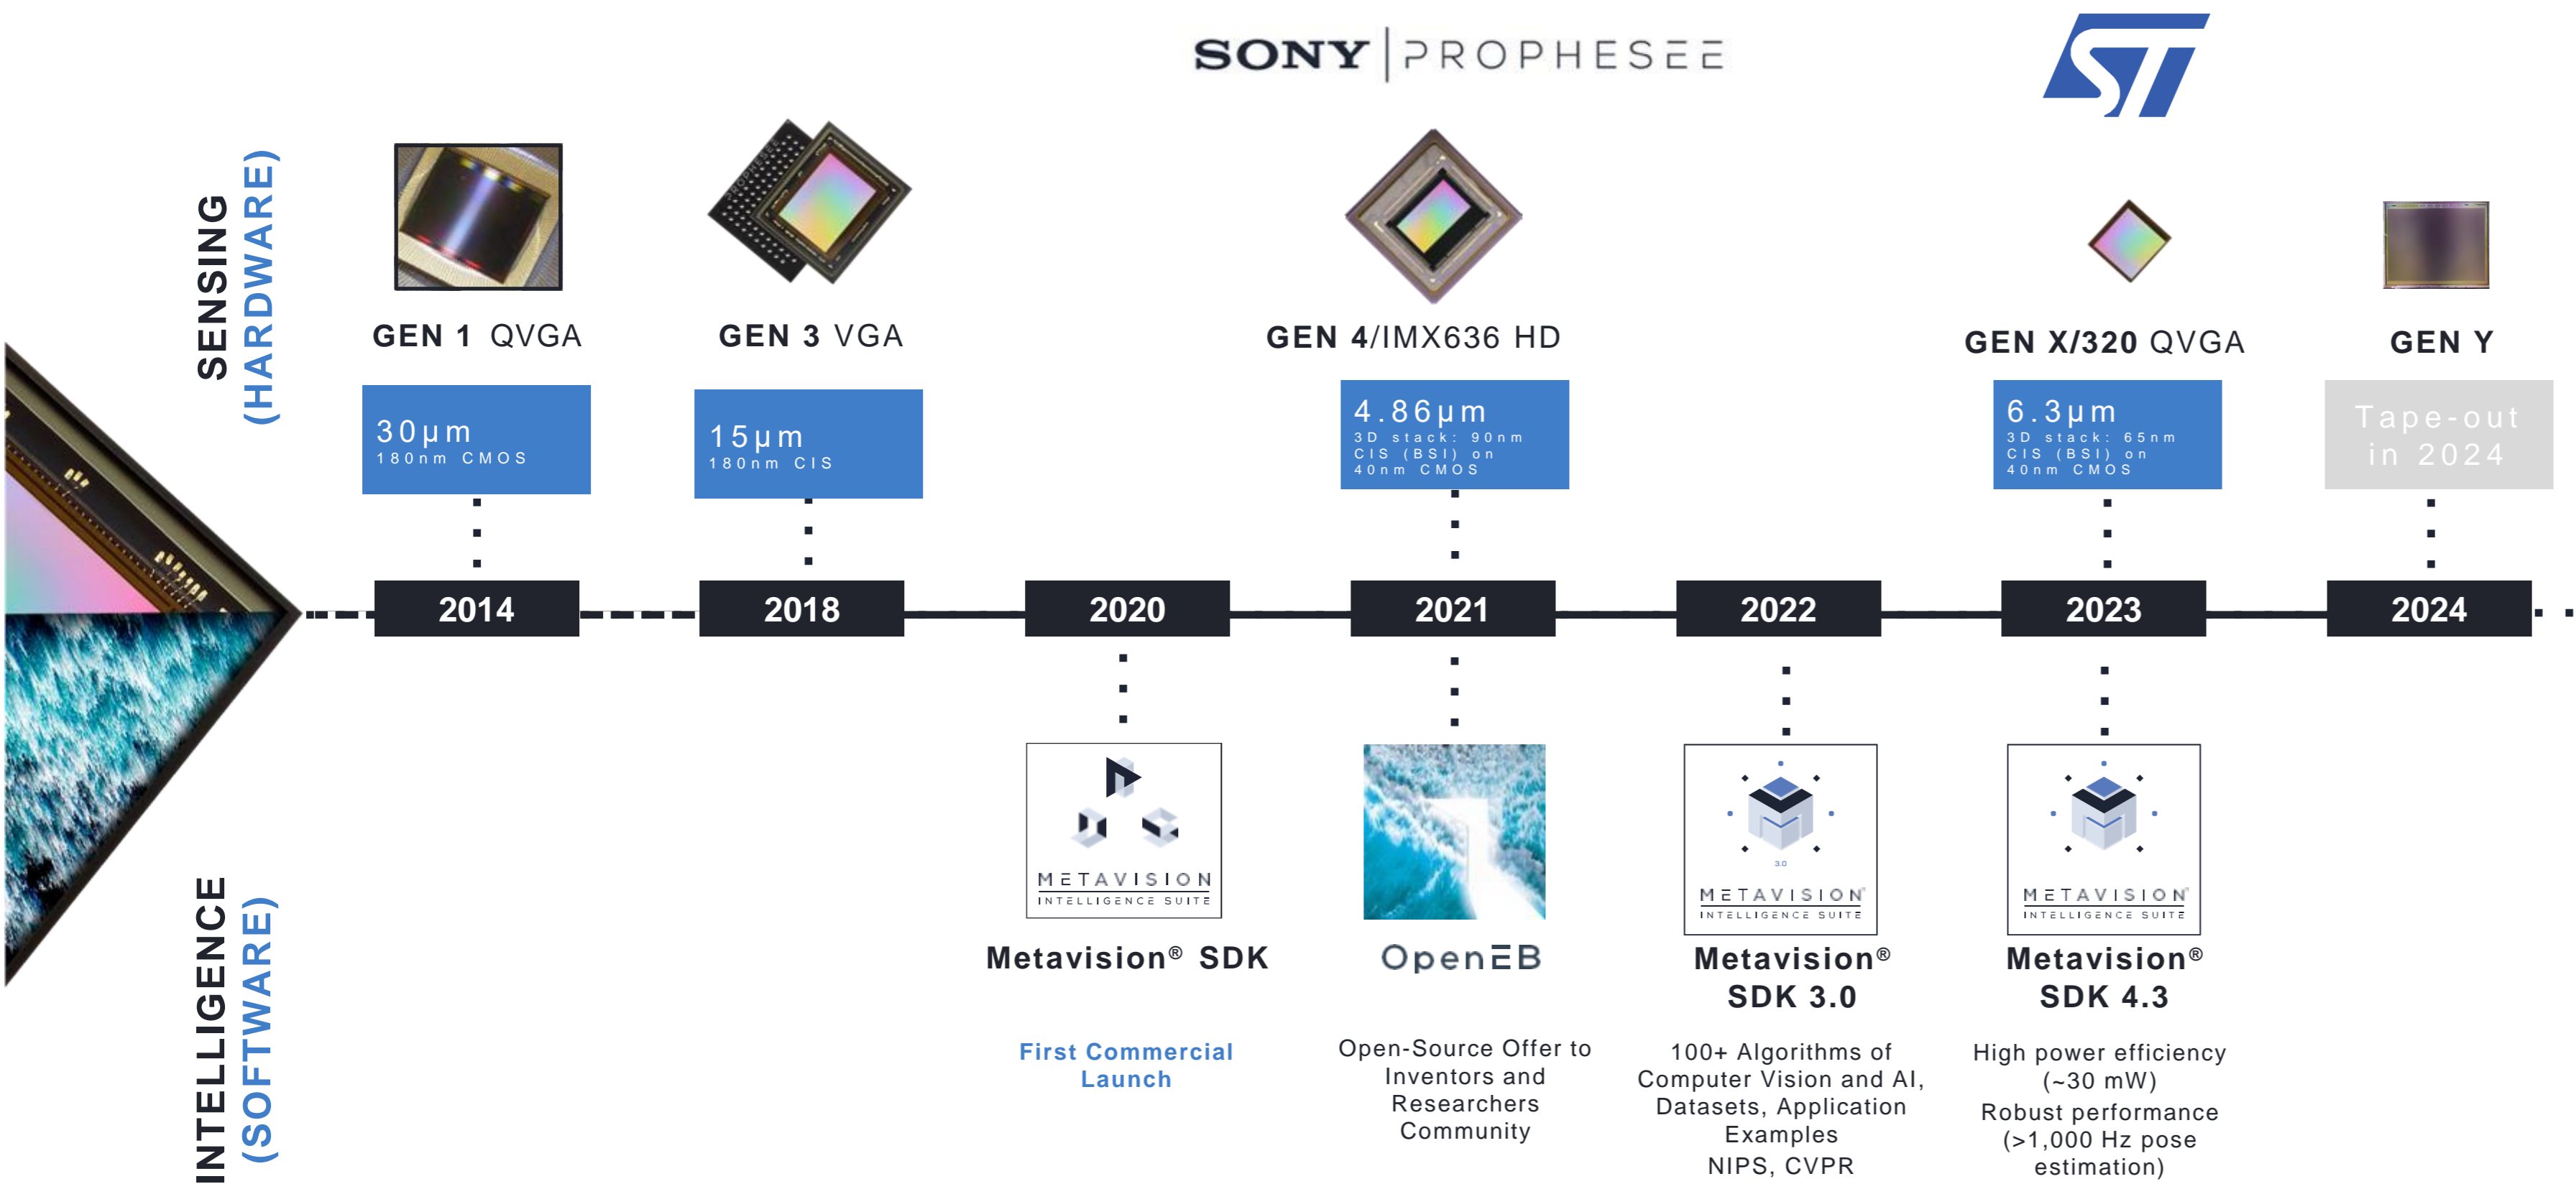

# PRODUCT EVOLUTION OVERVIEW

Five sensor generations, 100+ computer vision & AI algos, 1,000+ customers, 10,000+ inventors' community

The most advanced company in its capability to optimize and industrialize an event-based sensor

Vertical business model: hardware + software contribute to a comprehensive product portfolio

# EMERGING UNLOCK TRUE IMMERSIVE EXPERIENCE FOR XR

FRAME-BASED SENSOR

METAVISION® SENSOR

## EYE TRACKING

-- ULTRA FAST EYE TRACKING AT 1KHZ

- Non-verbal emotional communication
- Seamless navigation in menus
- Foveated rendering to unlock next-gen XR system performance (resolution – fps – autonomy...)

## GESTURE CONTROL

-- 3D HAND TRACKING AT LOW LATENCY

- High dynamic, real immersion experience
- Natural and accurate interaction without handle (click, grab, virtual keyboard...)
- Physical interaction and nonverbal communication between virtual humans

# ULTRA-LOW POWER ALWAYS-ON EDGE VISION FOR SMART HOME AND SMART CITIES

## FALL DETECTION

-- PRIVACY BY DESIGN

- A strong and quickly expanding pipeline in elderly care / smart home across major countries in Asia
- Can achieve <1% false alarm rate (much improved from current solutions)
- Strong privacy protection by design
- High robustness to fast motion / lighting condition and environment (eg water vapor)

## TRAFFIC MONITORING

-- HIGH DYNAMIC RANGE

- Low light detection and tracking
- Privacy protection
- Real time edge computing – no need for central data storage, drastically reducing computing load
